Executive summary

Capital markets have priced out the worst-case scenarios presented by U.S. policy uncertainty and global geopolitical risk. But these risks have not disappeared, and we are wary of their potential to accelerate late-cycle dynamics. We are not overly bearish on the U.S. or global economy, but transitions in the approach to economic policy and diplomacy widen the range of potential outcomes for investor portfolios. We believe this is a critical moment for investors to rethink allocation in light of shifting business, consumer, and geopolitical realities. **The goal isn't to avoid risk, but to take it deliberately.**

Over the past few months, investors have shifted from a “wait and see” posture to cautiously re-engaging. Liberation Day volatility is now firmly behind us and stable macro data had allowed global markets to recover.

In the U.S., hopes for a policy rate cut this month are broadening that recovery. In our view, a modestly lower cost of capital only goes so far to support an economy facing meaningful policy change. It is also only a small piece of an equity market whose otherwise narrow performance has been driven by the AI boom. Still, the signal is important, and will likely extend the risk asset rally in the near term.

The impacts of other policy change, including tariff-driven inflation and immigration-related shocks to labor supply, are becoming more visible. In our view, they will continue to impact economic activity, costs, and the ease of doing business.

We are not overly bearish on the U.S. economy, but our base case scenario is that growth will slow, cracks in employment will widen, and inflation will edge higher. If these expectations materialize, market pricing today is too complacent.

Outside the U.S., the picture is mixed. China's recovery remains uneven as

policymakers toggle between stimulus and structural reform. Japan's reflation experiment appears increasingly fragile. In Europe, growth is soft but stabilizing, with disinflation providing some policy breathing room – even as political risk creeps back into focus.

In public markets, U.S. valuations have completed a full V-shaped recovery, but U.S. tariff policy is still having an impact on investors' asset class and geographic preferences. Traditional relationships between asset classes like gold, oil, the U.S. dollar, and Treasuries appear to be changing, reflecting questions around demand for U.S. assets. In our view, this means investors must think more holistically about diversification, both within and across geographies.

In private markets, policy uncertainty stalled hoped-for improvements in deal flow. As clarity emerges, other forces for private markets resilience – strong credit quality, new sources of liquidity, democratization of access, lower interest rates – remain.

This piece is designed to share our holistic global economic, geopolitical, and asset allocation views. Use the links in the table of contents page to explore.

High conviction investment ideas

While uncertainty lingers, investors can move with confidence.

CALL OR CONDITION		INVESTMENT CONSIDERATIONS	
EQUITY	<ul style="list-style-type: none"> Policy risks are beginning to emerge in the data, as tariff-driven inflation and immigration-driven labor pressures become clearer. These indicators do not yet capture the full effects of recent policy changes, which will impact growth, costs, and business conditions. We expect market volatility to resume when the economic data reflects these risks more fully, making it essential to focus on earnings quality. In the near term, we expect steady macro data and a Fed rate cut could extend the equity market rally. As risks to U.S. growth and policy stability are raised, global investors have questioned their enthusiasm for U.S. assets. Investors may seek broader diversification; within equities, this may include attention to geographic and structural changes, such as the increase in defense and infrastructure spending in Europe. Small companies have less buffer against input price rises, and less opportunity to adjust supply chains. The trend in artificial intelligence is here to stay. Digital and energy infrastructure are already benefitting from sustained and diversified investment; we see this as a compelling entry point into the AI theme. 	1	Stay invested, with a focus on earnings quality.
		2	Investors can consider deploying equity-like risk into high yield corporate credit, where fundamentals and yields are attractive, outweighing price risk stemming from tight spreads in our view.
		3	Ex-U.S. outperformance is likely to slow after a strong H1, but we believe geographic diversification is prudent amid global risks.
		4	We strongly prefer large caps. Small caps will continue to underperform until growth is more resilient – unlikely this year.
		5	Diversify equity exposure into broader reflections of the AI theme, including energy, materials, and digital infrastructure.
FIXED INCOME	<ul style="list-style-type: none"> We expect the Fed to cut in September, making now an interesting time to lock in higher yields before they move modestly lower across credit asset classes. That said, we are doubtful that a September cut points to a prolonged interest rate cutting cycle. As such, careful credit selection remains a vital part of navigating this late stage of the economic cycle. The combination of sticky interest rates and tight credit spreads have investors wondering whether fixed income allocations are worth the risk. In our view, income generation opportunity is too attractive to let pass. We expect U.S. public credit quality (interest coverage, maturity timeline) to remain very strong by historical standards, supported by still-resilient economic activity levels. Fundamentals in European credit are attractive as well. At the same time, uncertainty around growth and inflation point to more volatile market interest rates. We favor a “buy and hold” short duration credit strategy to maximize these potential benefits. 	6	Staying short duration in credit allocation can solve for both rate volatility and any longer-term credit quality concerns.
		7	Volatility in the Treasury curve prompts our neutral-to-short duration preference. Consider short duration credit (IG, HY, munis) balanced with taxable munis, a high-quality infrastructure play.
		8	Strong fundamentals create an attractive opportunity in structured credit and convertible bonds. In floating rate loans, only the strongest portions of credit quality are likely to hold water.
OTHER	<ul style="list-style-type: none"> Incidence of geopolitical risk has moved higher since the COVID-19 pandemic and is gaining proximity to safe-harbor U.S. assets. At the same time, the risk of inflation surprises has increased. Investors may use diversification and inflation-aware exposures to hedge against these risks. Though the endgame of U.S. trade policy is uncertain, the global trends towards re-globalization, digitization (AI), and energy independence point to capital intensity, infrastructure investment, and stickier inflation. Private markets allocation is growing and democratizing. 	9	Consider a geopolitical risk hedge of equal parts oil, gold, and bitcoin as a satellite sourced from equity.
		10	Inflation-aware asset classes such as commodities, materials, and real estate may benefit from the macroeconomic backdrop.
		11	Qualified investors seeking diversification into the private markets may consider the more resilient lower middle market.

What's next for U.S. trade policy?

The precise path of tariffs is uncertain, but the effective tariff rate on U.S. imports has moved decisively higher.

- Even with the further extension of key tariff deadlines on trade partners including China, U.S. trade policy continues to evolve. Several major trade deals were announced in July, including with Europe, South Korea, and Japan, though key sector-specific tariffs are still under negotiation.
- Tariff policy is unlikely to stabilize before the midterms. The combination of negotiations, announcements, and ongoing legal challenges lead to ad hoc trade policy, creating further uncertainty for businesses. Looking ahead, we expect a regime of "moderate but elevated" tariffs – still the highest seen in nearly a century – accompanied by rolling negotiations and legal risks (**left chart**).
- At extreme levels, tariffs tend to destroy demand and weigh on prices. But when businesses and consumers can "muddle through," cost pressures can pass through more cleanly, reinforcing the upside risk to inflation. However, the timing of that impact is highly uncertain. In the meantime, tariffs are expected to bring in around \$200B in revenue, per the CBO, in FY2025 (**right chart**).

Regardless of negotiations, we expect a materially higher tariff rate on U.S. imports

Effective tariff rate calculated through August 6.

U.S. tariff revenue is on the rise

■ Monthly revenue, left axis — Trailing 12-month revenue, right axis

Sources: New York Life Investments Global Market Strategy, U.S. Department of Treasury, Macrobond, September 2025.

How are tariffs affecting the economy right now?

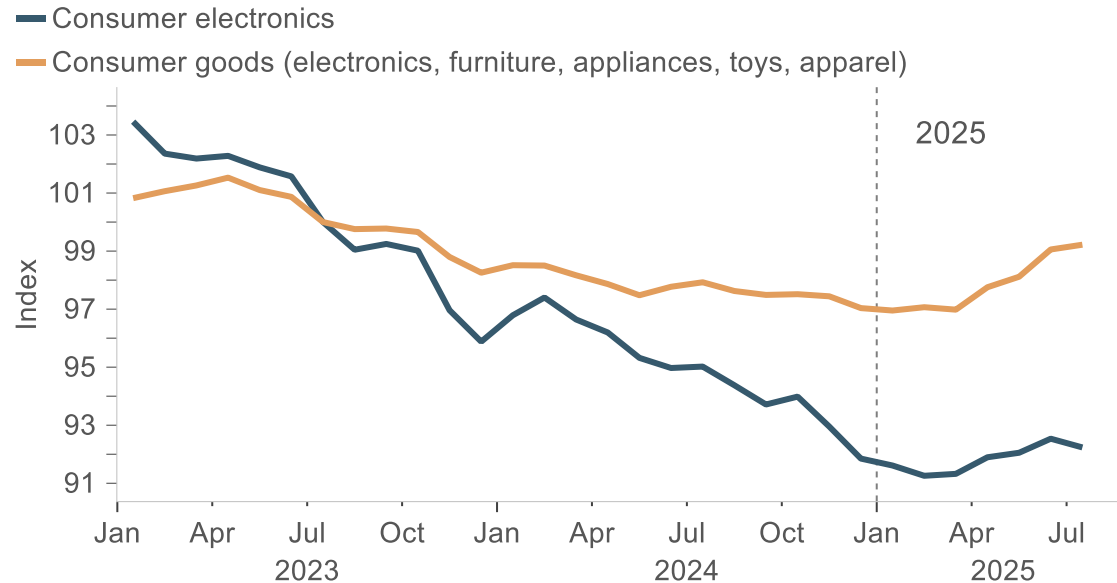

Prices – for both goods and services – in addition to sentiment and jobs data point to a slow pass-through of tariffs to economic activity.

- Tariff impacts are now showing up in inflation data, though not in the way many expected. Durable goods inflation is reaccelerating, particularly in household furnishings, consumer staples, and electronics (**left chart**), but services have been a key inflation culprit for both consumer and producer prices as well (**right chart**).
- Services drove a hot July PPI print and has been visible in higher services prices in CPI and higher prices paid in the Purchasing Managers Index (PMI) surveys of services companies. Some of this impact stems from higher transportation and logistics costs.

- Other data points to broadening tariff pressures. Recent jobs reports show a notable slowdown in private-sector hiring in May, June, and July. Consumer sentiment remains depressed at Global Financial Crisis levels. Looking ahead, we expect growing strain on inventory management, corporate investment, and consumers.
- Importantly: it may take another 6-9 months for first-order tariff impacts to make their way through economic activity. A more visible inflation impulse – or a real stall in hiring – could still be several quarters away.

Consumer sensitive goods are starting to show the impact of tariffs

Index (Jul 2023 = 100)

Sticky input prices for manufacturers are likely behind sticky services inflation

Sources: New York Life Investments Global Market Strategy, Institute for Supply Management (ISM), U.S. Bureau of Labor Statistics (BLS), Macrobond, September 2025.

How will policy changes impact the U.S. economy from here?

The U.S. economy is resilient, but changes to policy may continue to impact economic activity, costs, and ease of doing business.

- Stop-and-start tariff announcements and unresolved court cases make it challenging for consumers and businesses to make informed decisions about their environment.
- We are beginning to see a clearer impact of policy change on the economy. Though layoffs have not picked up yet, hiring has slowed meaningfully. Consumer spending has deteriorated this year, and goods inflation began to rise. Earnings reports show some companies materially impacted by margin compression, though this may see some offset from tax cuts and deregulation expected later in the year.

- Much is likely still to come in terms of policy impact. For example, we believe that businesses are unlikely to pass along holistic tariff-related price increases until there is (1) greater certainty on tariff levels and (2) tariff-impacted inventory. This could come as over the next 6 months as tariff impacted goods hit the shelves.
- We will continue watching pricing of consumer electronics, apparel, and consumer staples – all of which are already showing signs of tariff-related price increases – to get a sense of how businesses are passing on the costs to consumers.

Tighter immigration controls may place pressure on labor supply
Shock to labor market supply presents an upside risk to inflation, placing upward pressure on wages

Tax clarity (and support) from the One Big Beautiful Bill may provide a tailwind to business activity

Capex and R&D may be pulled forward

Government shutdown possible if FY26 appropriations remain unresolved in Q4

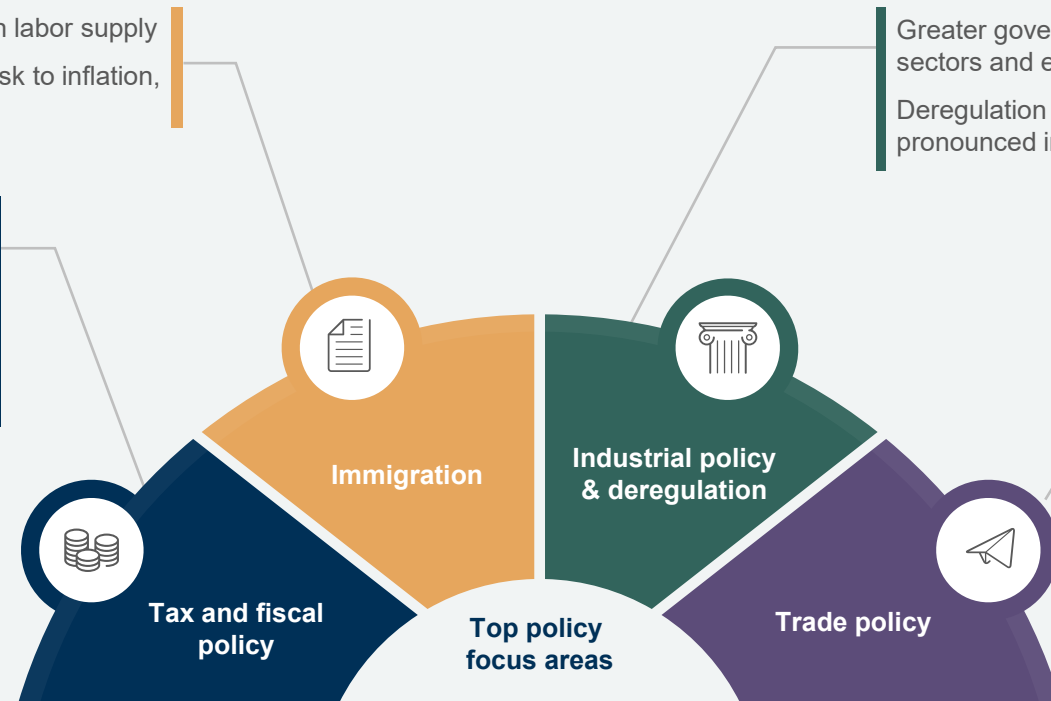

Greater government support for industries may bolster strategic sectors and encourage innovation
Deregulation will accelerate into H2, with impacts likely to be most pronounced in energy, financial services, and tech.

Trade policy uncertainty will continue as:

- Reciprocal tariff implementation stops and starts due to court rulings and appeals
- Sectoral tariffs are announced on goods such as semiconductors and pharmaceuticals

Costs to businesses are likely to rise into H2 as higher tariffs come into effect

So far, data suggests companies are passing along price increases from tariffs, but, looking ahead, some companies may decide to reduce margins to preserve market share

Tariff dates to watch

- **October 29:** 90-day pause on Mexico tariffs expires
- **November 10:** 90-day pause on China tariffs expires

Can the Fed cut rates more rapidly this fall?

While we expect a 25bp cut in September, we do not yet see evidence for a sustained easing cycle.

- If it weren't for recent policy changes – tariffs in particular – the Fed might already be cutting rates, as the labor market came into better balance and inflation moderated in the first half of the year.
- Today, the Fed's mandates face opposing pressures. Late-cycle dynamics and slowing job growth argue for cuts, while acceleration of inflation, caused by tariffs and wage pressure from tighter immigration, is biasing the Fed not to cut (**left chart**). Recent data shows job growth has been weaker than previously assumed, shifting the balance of risks, in our view, towards labor market fragility and a likely rate cut (**right chart**).
- We expect the Fed to deliver a September rate cut, but a sustained easing cycle still looks unlikely, absent a material slowdown. Inflation risks remain broad-based – tariffs, corporate margin protection, and falling labor supply all pose upside risks. Meanwhile, loose financial conditions, strong equities, tight credit spreads, ample liquidity, make it difficult to justify rapid easing cycle.
- Finally, if markets come to view the Fed as acting politically, interest rates are likely to rise, reflecting concerns over policymaking credibility – even as policy rates move lower.

The Fed's mandates are facing opposite pressures

Biasing the Fed to cut rates

Housing market slowdown

Cycle slowdown: employment moderating; inflation lower; consumer spending shows early signs of slowdown

Biasing the Fed not to cut rates

Wage pressure from tighter immigration

Goods price pressure from tariffs

Loose financial conditions

Supply side shocks – not much Fed policy can do

Opinions of New York Life Investments Global Market Strategy, August 2025.

Fed's balance of risks shifting as job growth continues to slow

Sources: New York Life Investments Global Market Strategy, U.S. Bureau of Labor Statistics (BLS), Macrobond, September 2025.

Why the recent focus on immigration?

We believe investors and the market may be missing an important upside risk to inflation – a shock to labor market *supply*.

- Over the course of 2025, the U.S. labor market has moved closer to balance. After several years of strong labor demand and elevated wage growth, both have moderated in recent months. As major components of GDP—particularly consumption—have also slowed in the first half of the year, many economists and investors are watching the labor market closely for signs of further softening. A weaker labor market would increase downside risk to growth and likely strengthen the case for interest rate cuts. Recent labor market data suggests this softening is happening.
- One emerging factor that could complicate this narrative is U.S. immigration policy. Tighter immigration controls (**left chart**) appear to be placing early pressure on labor supply. While the full economic effects are still developing, the labor market is likely to be the first channel through which these changes are felt. Reduced labor supply could lead to slower job creation (**right chart**), even as the unemployment rate falls and wage pressures re-accelerate. In this scenario, financial conditions could tighten as markets reassess the likelihood of further Fed easing.

Immigration prosecutions are on the rise

■ Number of U.S. immigration prosecutions, monthly

Examining the U.S. labor force impact of less immigration

Sources: Candriam (A New York Life Investments Company), August 2025. NFP stands for non-farm payrolls, and the NFP breakeven refers to the monthly job growth number needed to keep the unemployment rate stable, all else equal.

Are ex-U.S. investors shedding U.S. assets?

The near-term narrative of investors reducing U.S. exposure is overblown at minimum, if not outright false.

- One of the stickiest themes in global allocation this year is some version of the question: “are investors flocking for the exits?” Recent data shows that this is not (yet) the case.
- U.S. Treasury flows data through the first half of this year shows foreign preference for U.S. securities remains stable. Net foreign buying of U.S. Treasuries continues while the Fed shrinks its balance sheet (**left chart**).

H1 2025 Treasury demand: Foreign buying of Treasuries continues while the Fed shrinks its balance sheet

Net purchases of U.S. Treasuries

Sources: New York Life Investments Global Market Strategy, U.S. Department of Treasury, Federal Reserve, Macrobond, September 2025. Foreign purchases ascribed to each country include purchases by central banks, financial institutions, institutional investors, mutual funds, and households.

- Private investors (investment funds, corporations, individuals; **right chart**) are driving purchases of U.S. equities, while Treasury and corporate bond demand remains stable.
- That said, a key caveat is timing. As we explore in our [private markets outlook](#), our conversations with investors suggest that ex-U.S. investors – particularly in Europe – are hesitant to deploy new capital to U.S. based private investments. However, illiquid exposure, and the dollar's depreciation, makes outright sales unlikely in the near term.

Foreign investors: demand for U.S. assets remains high

Net purchases of U.S. securities by foreign private investors

Sources: New York Life Investments Global Market Strategy, U.S. Department of Treasury, Macrobond, September 2025.

What's driving U.S. dollar dynamics?

As demand for U.S. assets remains robust, so does relative dollar strength.

- After an early-year slide, the USD has settled into a range as resilient demand for U.S. assets persisted. We don't expect the U.S. dollar index to return to 2023-2024 levels, especially as the Fed prepares to cut rates, but stability in the USD is likely to support foreign investor sentiment towards U.S. exposure.

The U.S. dollar fell with the sell-off in U.S. equities earlier this year but has since leveled off

Sources: New York Life Investments Global Market Strategy, Intercontinental Exchange (ICE), S&P Global, Macrobond, September 2025. EAFE is represented by the MSCI EAFE index which covers non-U.S. developed market equities. The S&P 500 index is a stock market index tracking the stock performance of 500 leading companies listed on stock exchanges in the United States. It is not possible to invest in an index. Past performance is not a guarantee of future results.

- Though the factors driving currency volatility are complex, we believe the largest drivers of change are stemming from policy uncertainty: central banks are rebalancing reserves, and investors are rebalancing their portfolios. Even on the margin, these changes can have meaningful implications for allocation.
- Central bank reserve portfolios are adapting to a more fragmented and uncertain global order. Many have continued de-dollarizing, with gold playing an increasingly important role.

Gold surpasses euro as second-largest reserve asset

Composition of global reserve assets

Sources: New York Life Investments Global Market Strategy, ECB, Macrobond, September 2025.

What does this mean for global asset allocation?

U.S. assets remain dominant in global allocations, but other markets have shown signs of life – and even outperformance

Non-U.S. asset class performance has slowed in the past quarter

Global investors are reassessing their allocation to U.S. assets

- Policy uncertainty in the U.S. has challenged investor expectations about the U.S. and global economies, market volatility, and even traditional asset class relationships. In response, investors are questioning long-term U.S. economic leadership, and whether U.S. assets play the same “safe haven” role they have in the past.
- Despite these important changes, our expectation is that U.S. assets – and the connection to U.S. sources of growth, innovation, and return potential – remain dominant in global allocation. There is simply no alternative to the depth and liquidity of U.S. capital markets today. However, even changes on the margin can have an impact on ex-U.S.

Portfolio flows are showing early signs of regional rebalancing

- Investors are expressing renewed enthusiasm about non-U.S. assets amid a modest cyclical upturn and relative political stability.
- Some global allocators are prioritizing alignment with supply chain hubs and strategic industries like defense and technology outside the U.S.

Will non-U.S. markets extend their lead?

- Not necessarily. Faster rate cuts abroad have helped normalize yield curves, modestly revive credit creation, and support more rate-sensitive sectors like financials and industrials. We think it’s unlikely that ex-U.S. asset maintain the pace of their recent outperformance. But if these fundamental trends hold – especially as U.S. policy risk remains high – non-U.S. assets may keep their edge.

Resilient U.S. activity faces risks from a late-cycle economy and policy uncertainty

The U.S. economy is coming from a strong starting point, but risks of higher inflation and slowing growth persist.

- U.S. GDP growth in the post-pandemic period stabilized above its trend pace of 2.0-2.5%, driven largely by strong consumer activity, which comprises about two-thirds of U.S. economic activity. Consumers have been boosted by a well-balanced labor market, with both income and wealth effects supporting high-income segments in particular.
- We believe U.S. economic growth is likely to moderate in the coming 12 months, as a

broad range of policy changes gradually translate to higher prices for households and uncertain hiring and investment outlooks for businesses.

- We are focused on consumption and investment to give us a sense of the underlying growth impulse of the economy; we expect continued distortions from net exports and inventories as a result of tariff uncertainty.

Consumer spending is showing signs of softening which may signal the early stages of an economic slowdown

The Federal Reserve faces a tricky balance between its mandates

While we expect a 25bp interest rate cut in September, we see a sporadic easing cycle ahead at most, and no current case for sustained easing.

- Policy uncertainty pressures the Fed's mandates in opposite directions: upside risk to inflation, and downside risk to growth. Recent data emphasize both points: consumption and job creation are deteriorating, but wage growth and goods prices are sticky.
- The sequencing of how these risks hit the economy will be a crucial driver of Fed policy. We expect a 25bp cut in September to address labor data that has been revised

weaker, and further sporadic cuts are possible if inflation remains relatively muted.

- But selective cuts are signals, not fundamental shifts for those looking for relief in credit creation or asset purchase financing. A sustained, or faster, easing cycle is unlikely to materialize amid ongoing inflation risks and loose financial conditions.

The market is expecting interest rates to remain structurally higher

Federal funds rate and implied Fed funds futures curve

Our Fed cuts checklist: conditions tenuously met, allowing small space to ease

Condition	Status	View
Inflation expectations well anchored	Long-term inflation expectations remain well anchored.	✓
Core inflation moving closer to target	Core inflation is still above the Fed's target but has made significant progress over the last year. Policy risk amid resilient growth may re-firm inflation, which would slow the Fed's pace of cuts all else equal.	—
Unemployment rate $\geq 4.0\%$	The labor market has come into better balance this year, but immigration policy changes mean labor supply is falling, which may push the unemployment rate <i>lower</i> – increasing wage risk.	—
Wage growth commensurate with stable prices	Wage growth has neared the 3.5% year-on-year figure that we believe would make the Fed comfortable with maintaining a rate cutting cycle. Stickier wages would mean stickier rates.	—
Financial conditions still well behaved	The Fed would need to see a strong deterioration in financial conditions – and therefore a visible risk to the economic outlook – before pre-emptively easing. Using 2018's "insurance" cuts as a guideline, we expect that an equity market selloff of 20%+ would be required to prompt Fed action.	—

Opinions of New York Life Investments Global Market Strategy, September 2025.

Fed balance sheet tightening is at its end

Quantitative tightening (QT) was slowed in March and is likely to end this year as the Fed achieves its reserve management goals.

- The Fed's balance sheet, as any balance sheet, is made up of assets (**left chart**) and liabilities (**right chart**). As the Fed reduces its assets via QT – having shaved off \$2T in assets since 2022 – it must also reduce its liabilities.
- Fed liabilities include bank reserves (blue area, right chart), currency in circulation (green area), and vehicles for liquidity support such as its reverse repo facility (orange area).

- Post-pandemic, the Fed kept reserve levels abnormally “abundant” to ensure maximum flexibility in supporting liquidity and bank functioning. Needs for liquidity support are lower today, allowing the Fed to reduce reserves toward “ample” levels; the Fed has also considered shifting the duration profile of its balance sheet to provide policy flexibility.
- The optimal level of Fed assets at which the Fed should halt its QT is hotly debated among practitioners and is a subjective estimate, even for the Fed itself.

Asset side of balance sheet: Fed has tapered nearly all its pandemic purchases

— Fed assets held outright ■ Other ■ Repos, premiums/discounts ■ Agencies ■ MBS ■ Treasuries

Sources: New York Life Investments Global Market Strategy, Federal Reserve, Macrobond, September 2025. MBS: Mortgage-backed securities. Agencies: Agency-backed securities. Repos: repurchase agreements, used to adjust systemic liquidity. Other: misc assets amassed during GFC, including Term Asset-Backed Securities Loan Facility, used to create asset backed securities of consumer loans.

Liability side of balance sheet: from "abundant" to "ample" reserves

— Total Federal Reserve Liabilities ■ Other liabilities ■ Currency in circulation ■ Reverse repurchase agreements ■ Bank reserves

Sources: New York Life Investments Global Market Strategy, Federal Reserve, Macrobond, September 2025. Reverse Repurchase Agreements area a facility used by the Fed to support bank liquidity. Other liabilities include non-reserve deposits held by the Federal Reserve.

Market rates are likely to be rangebound and volatile in our view

Long-term rates will be torn between upside inflation risks and downside growth risks. Investors should expect more rates volatility in response.

- Long-term interest rates are driven by expectations for inflation, the policy rate path, and the term premium, which encompasses expected supply and demand for Treasuries.
- Higher long rates today reflect rising near-term inflation expectations, a belief that the policy rate will not revert to previous lows this cycle, and the possibility of higher Treasury issuance relative to demand, as reflected in a rising term premium.

- The 10Y remains torn between the administration's stated focus on bringing down the 10Y yield and mounting questions around long-term supply and demand for Treasuries.
- From here, we have a very wide range of expectations for the 10Y as markets balance inflation and growth risks: 4.0-5.0% over the next 6 months. The resulting volatility increases our conviction that duration is not where we prefer to take risk.

Composition of the 10-year Treasury yield: real rates have led nominal yields higher

Source: New York Life Investments Multi-Asset Solutions, Federal Reserve, U.S. Department of Treasury, Macrobond Financial AB, Macrobond, 9/2/2025. Figures may not sum due to rounding. The nominal yield is the stated yield on an investment, before adjusting for inflation. The real yield is the yield adjusted for inflation. Past performance is not a guarantee of future results.

The rising term premium reflects expectations for greater Treasury supply (issuance) relative to demand

Sources: New York Life Investments Global Market Strategy, Bloomberg Finance LP, Macrobond, September 2025.

Rates volatility raises questions for the yield curve, and for bank lending

Both supply and demand of loans to businesses and households had moved from depressed levels to neutral, but we see risks to both.

While the 2Y-10Y spread has normalized, the 3M-10Y spread is hovering near zero. This is driven by a shallower-than-expected easing cycle on the front end and volatility on the long end of the curve. It is likely that growth expectations and policy uncertainty, not the state of normalization of the yield curve, will drive near-term loan demand.

Tight lending standards typically precede economic contractions, but the most recent era of restrictive conditions did not produce a recession. The Senior Loan Officer Opinion Survey (SLOOS) now points to lending slightly tightening for businesses but loosening for households.

On the demand side: late in 2024, both households and businesses were exiting an era of depressed demand for bank loans. Looking ahead, policy uncertainty is likely to push out major borrowing decisions by both corporations and households.

The Treasury yield curve has finally normalized across tenors

Loan demand has improved to neutral for both businesses and households

Sources: New York Life Investments Global Market Strategy, Federal Reserve, Macrobond, September 2025.

Market-determined financial conditions are very loose today

The recent rally in risk assets has priced out policy risks. We are watching closely.

- Market-determined financial conditions are not meaningfully tight (**left chart**), as equity valuations have regained historic highs and corporate credit spreads sit near historically tight levels (**right chart**).
- In our view, current financial conditions – driven in large part by market valuations - do not reflect the reality of policy uncertainty that the real economy faces, but the market may have 6-9 months of runway as tariff impacts are slow to reach the real economy.

- While we expect some spread widening, we remain constructive on credit quality in the near term. Even amid tariffs, post-pandemic programs and improved cash management support confidence in corporates' ability to repay over the next 2–3 years. A sharp downturn could lift default rates broadly, but high-quality issuers are less likely to be affected.

Market financial conditions are not tight, but can change on a dime

Spreads are near historic lows for high yield credit

Inflation shows early signs of reacceleration

Inflation – for both goods and services – is showing early signs of reaccelerating as policy changes work their way through economic activity.

- While U.S. inflation has moderated significantly from its mid-2022 peak, tariff impacts now appear to be showing up in inflation data.
- Durable goods inflation is reaccelerating, particularly for imported items such as household furnishings, consumer staples, and electronics.
- Somewhat unexpectedly, services inflation for both consumer and producer prices is

also on the rise, with higher transportation and logistics costs a contributor.

- Upside risks to inflation persist as tariffs work through sentiment and markets and tariff-impacted inventories hit shelves. In our view, it may take 6–9 months before the full impact is known; we'll be watching consumer electronics, apparel, and consumer staples for confirmation.

Core goods and core services inflation are on the rise

— Headline CPI — Core CPI — Energy — Food — Shelter — Core Goods — Core Services

Sources: New York Life Investments Global Market Strategy, U.S. Bureau of Labor Statistics (BLS), Macrobond, September 2025.

PCE inflation is far from peak, but progress toward target may have stalled

— Headline PCE — Core PCE — Fed target: 2% — Recession

Sources: New York Life Investments Global Market Strategy, U.S. Bureau of Economic Analysis (BEA), NBER (National Bureau of Economic Research), Federal Reserve, Federal Reserve Bank of New York, Macrobond, September 2025. PCE: Personal Consumption Expenditure, the Fed's targeted inflation measure

Upside risks to inflation stem from shocks to supply chains, tariffs, and labor supply

It takes only incremental monthly increases, particularly in the largest components of the inflation basket, to create a double peak in inflation.

- Inflation reacceleration risk is top of mind: monthly increases greater than 0.2% in inflation are a cause for concern.
- Two supply-side shocks – tariffs and a tightening of labor supply through immigration changes – are worrying for Fed policy – which impacts the demand side of the economy.
- Interest rate policy is unlikely to be effective in taming these supply-side shocks.

Incremental monthly increases could easily create a reacceleration trend in CPI

12-month ahead CPI evolution based on M/M scenarios

Sources: New York Life Investments Global Market Strategy, U.S. Bureau of Labor Statistics (BLS), Macrobond, September 2025. The Consumer Price Index (CPI) is a measure of the average change over time in the prices paid by urban consumers for a market basket of consumer goods and services.

- Aside from tariff impact, shelter inflation has been a key price pressure. It remains stubborn due to tight supply and resilient demand. A decade of underbuilding and locked-in low mortgage rates keep inventory constrained, while demographic trends sustain demand.
- Meanwhile, higher labor, materials, and insurance costs also keep maintenance costs high. These costs impact both owners and renters in the CPI basket.

The largest components of the inflation basket are also seeing fastest pace of price growth

■ Component's weight in CPI basket vs latest pace of inflation (trailing 6-month average)

Sources: New York Life Investments Global Market Strategy, U.S. Bureau of Labor Statistics (BLS), Macrobond, September 2025.

Inflation expectations also point to upside price risk

Elevated inflation expectations reflect greater policy uncertainty, and expectations can drive inflation itself.

Near-term inflation expectations tend to be more volatile than longer-term expectations, as long as the market believes the Fed can hold to its 2.0% target. Near-term TIPS breakevens have recovered the most from their tariff-related increases earlier this year, though broader asset allocation choices may be playing a role here.

Inflation swaps have a more compressed range but point to the same trend as breakevens: near-term inflation expectations de-anchored, recovering only modestly while long-term inflation expectations are compressed by concerns about the structural growth outlook.

Consumer surveys are naturally noisy, but the recent spike in inflation expectations shows consumers are extremely worried about prices – specifically, a tariff-led reacceleration in inflation. Expectations for 1-year forward inflation in the U Mich survey are nearing 5.0% and 5-year expectations are near their highest levels since the '90s.

Long-term TIPS-derived inflation breakevens are well anchored; near-term remains volatile

— US Breakeven 10 Year
— U.S. Breakeven, 5yr/5yr Forward
— US Breakeven 1 Year

Sources: New York Life Investments Global Market Strategy, Bloomberg Finance LP, Macrobond, September 2025. Inflation breakevens are the implied rate of inflation implied by the pricing of TIPS, Treasury Inflation Protected Securities. The 5yr 5yr breakeven: expected inflation in 5 years, for the following 5 years.

Zero-coupon inflation swaps also point to a more volatile near-term inflation outlook

— 1-Year Swap — 5-Year Swap — 10-Year Swap
— 30-Year Swap

Sources: New York Life Investments Global Market Strategy, Bloomberg Finance LP, Macrobond, September 2025. A derivative used to transfer inflation risk from one party to another through an exchange of cash flows. In a zero coupon inflation swap, only one payment is done at maturity where one party pays a fixed rate on a notional principal amount, while the other party pays a floating rate linked to an inflation index.

Consumer inflation expectations remain elevated

— U Michigan Survey, Inflation 5 Years Ahead
— U Michigan Survey, Inflation In Next Year

Sources: New York Life Investments Global Market Strategy, University of Michigan, Federal Reserve Bank of New York, Macrobond, September 2025.

While the labor came into better balance in the first half of the year...

The labor market came into better balance in H1, with households maintaining broad employment and wage growth normalizing.

- Labor market stability has been paramount to our economic view; strong wages and job availability have carried consumers through an inflationary environment. Now, we see mounting risks that companies will simply pause hiring plans, possibly prompting a more marked deterioration in the labor market than would otherwise be expected in a standard easing cycle.

Job growth gradually decelerated during rate hikes to normalized levels

Sources: New York Life Investments Global Market Strategy, U.S. Bureau of Labor Statistics (BLS), Macrobond, September 2025.

- Jobless claims typically serve as an early warning for labor market weakness, yet they have remained low throughout the Fed's hiking and cutting cycle. So far this year, weekly claims have averaged 226k, signaling continued strength. We see 250k to 275k as the key threshold where investors should be wary of a labor market downturn.

Jobless claims should provide an early signal of labor market weakness

Sources: New York Life Investments Global Market Strategy, U.S. Department of Labor, NBER (National Bureau of Economic Research), Macrobond, September 2025. High risk level reflects opinions of the Global Market Strategy team.

... both demand-side and supply-side cracks are emerging

Hiring and wage growth continue to slow, but changes in immigration labor supply may reaccelerate wage pressures.

- Regarding labor demand: over the last several quarters, the labor market has moved from an overheating level into better balance.
- Though alarm bells are not ringing yet, a slowing quits rate, fewer job openings, and fewer jobs created each month suggest that labor demand is weakening on the margin.

Labor demand has come into better balance

- Regarding labor supply: deportations could influence jobs data moving forward, potentially reversing recent labor market softening. With a smaller workforce, the U.S. economy may be able to add fewer jobs without a spike in the unemployment rate. In a more extreme scenario, the unemployment rate may move *lower*, which could create wage pressures.

Labor supply could be constrained by deportation efforts

The U.S. consumer remains resilient...

Consumer spending, primarily by high-income households, has historically made up the lion's share of U.S. economic growth.

- U.S. homeowners were almost entirely shielded from the Fed's hiking cycle. Homeowners' equity is still near the highest level on record and financial assets have been bolstered by strong capital markets performance. This positive wealth effect has supported higher-income household consumption, seen in rising credit card balances (without rising default rates).
- High-income consumers make up a large portion of consumer spending. Equity market pressure remains a risk in that it may be enough to cause these consumers' confidence to wane, weighing on overall consumer activity.
- Consumers no longer have a savings backstop; "excess savings" have long been drawn down. A lower savings rate is likely a point of vulnerability in a rising inflation scenario.

Consumer balance sheets are healthy...

Sources: New York Life Investments Global Market Strategy, Federal Reserve, Macrobond, September 2025.

...but savings are being drawn down

Sources: New York Life Investments Global Market Strategy, National Association for Business Economics, NBER (National Bureau of Economic Research), U.S. Bureau of Economic Analysis (BEA), Macrobond, September 2025.

High-income earnings generate the majority of consumer spending

2024 consumer spending by income quartile

Sources: New York Life Investments Global Market Strategy, U.S. Bureau of Labor Statistics (BLS), Macrobond, September 2025.

...but Americans have seen no price relief in four years

“Main street” inflation is squeezing consumers and likely to squeeze further, particularly younger and lower-income segments.

- Wall Street focuses on inflation's rate of change, but Main Street lives with permanently higher prices. Even though the *pace* of inflation has cooled, *price levels* haven't fallen, keeping household budgets under strain. For consumers, it's not about "how fast" prices are rising anymore – it's that the new price plateau is significantly higher than before.

Price levels continue to inflate, which matters more than inflation pace for consumers

Sources: New York Life Investments Global Market Strategy, U.S. Bureau of Labor Statistics (BLS), Bank of America, Macrobond, September 2025. Consumer Price Index (CPI) is a measure of the average change over time in the prices paid by urban consumers for a market basket of consumer goods and services. Core CPI excludes food and energy prices.

- Historically, consumer spending holds up until layoffs become widespread. Behavioral economics research confirms that spending patterns shift when people witness job losses within their social or professional networks. Fear of being the next person laid off erodes confidence, stokes precautionary savings, and harms consumer demand. These conditions are not overly apparent, suggesting this key source of consumer support is intact.

Job loss anxiety is on the rise after a period of stability

Survey of consumer expectations: Job separation expectations (How worried are you about losing your job?)

Sources: New York Life Investments Global Market Strategy, Federal Reserve Bank of New York, NBER (National Bureau of Economic Research), U.S. Bureau of Labor Statistics (BLS), Macrobond, September 2025.

Consumer credit faces risks but from an aggregate healthy position

Though lower-income and younger households are struggling, we see no *systemic* signs of consumer overleverage or credit quality concerns.

American consumers are not over-leveraged. Mortgage debt service (orange line) is near its easiest point on record, keeping overall debt service comfortable on aggregate.

Consumer credit growth plummeted to just below zero in January 2025, but off a historically strong base of credit growth. We are monitoring consumer credit closely: requiring credit to finance normal spending is not healthy, but nor do we want to see a collapse in consumer loan demand.

Pockets of stress, namely among younger and lower-income segments that lack a savings backstop, are likely to worsen as growth slows and inflation reaccelerates. In these groups, we see higher credit card balances and rising delinquencies in credit cards and auto loans.

The household debt imbalance that preceded the GFC is nowhere to be found

Sources: New York Life Investments Global Market Strategy, Bloomberg Finance LP, Federal Reserve, Bloomberg, Macrobond, September 2025.

Consumer credit growth has notably slowed off a strong base

Sources: New York Life Investments Global Market Strategy, Federal Reserve, NBER (National Bureau of Economic Research), Macrobond, September 2025.

Credit quality issues are concentrated, not broad based

Sources: New York Life Investments Global Market Strategy, Federal Reserve Bank of New York, Macrobond, September 2025.

Housing supply and affordability issues are unlikely to budge

Home prices have a strong floor for the medium term – even with expectations for more volatile mortgage rates and pressure on growth.

Housing supply has become a “tale of two markets.” Record housing construction in the past few years has resulted in price moderation in the sun belt, while constrained supply on the coasts remains a challenge. And, though affordability is a structural issue for younger segments, home equity has been a boon to owners.

Accordingly, housing sales volumes are depressed. Existing homeowners are unwilling to give up a paid-off home or low mortgage rate in favor of a more expensive mortgage. Transactions are concentrated in newly built homes, where new supply exists and low maintenance costs attract new homeowners who are stretched with high mortgage rates.

It would take meaningful market shifts – greater housing supply, and/or meaningfully lower mortgage rates – for these dynamics to improve. The average effective mortgage rate is 4.1%; 75% of homes already have a mortgage rate under 5.0%. Accordingly, modest mortgage rate relief is not enough to change the incentive to buy or move homes.

The U.S. housing shortage has put a floor under prices

Existing homeowners are unwilling to give up their low mortgage rates

Mortgage rates would need to plummet to incentivize housing turnover

Business sentiment remains tepid

We will be monitoring both large and small business sentiment for impacts of tariffs, immigration policy shifts, and deregulation.

- Services and manufacturing sector sentiment has been on the decline since the beginning of the year, suggesting weakening economic activity in both segments.
- We expect large business sentiment to deteriorate further as input costs rise and capex-related uncertainty increases.

Services and manufacturing PMI has declined in recent months

Sources: New York Life Investments Global Market Strategy, Institute for Supply Management (ISM), Macrobond, September 2025. PMI: Purchasing Managers Index, a survey-based sentiment indicator.

- Small business sentiment dramatically improved post-election and historically corresponds to consumer sentiment among Republican party supporters.
- Restrictive interest rates were not small businesses' largest problem this cycle – inflation and labor market challenges were more important. However, we note the increase in concern about lower sales on the list – an early indication of potential slowdown.

Small business optimism remains elevated, but interest rate cuts do not solve their top problems

Survey of small businesses' "single most important problem":

Sources: New York Life Investments Global Market Strategy, National Federation of Independent Business, Macrobond, September 2025. Data presented as 3-month moving averages.

Businesses' healthy profit levels may be at risk

Hardy corporate profits provide a strong base, but we expect a deterioration as policy uncertainty, lower growth, and higher inflation hit margins.

- Today's corporate profit margins have been largely resilient, making near-term mass layoffs unlikely.
- However, as higher input costs and lower growth pressure margins, and as uncertainty affects business confidence re: investment and hiring outlooks, we expect profit growth to decelerate.

Hardy corporate profit growth remains a sign of overall business health

■ Corporate profit growth ■ Recession

Sources: New York Life Investments Global Market Strategy, Federal Reserve, NBER (National Bureau of Economic Research), Macrobond, September 2025.

- Companies have been maintaining healthy margins. Today, S&P 500 operating margins are well above 12.5%, the level at which falling margins have historically become a concern.
- Technology-driven productivity improvements could support margin expansion in the medium term, but we believe consumer spending and inflation are likely to dominate the near-term story.

Despite slowing growth and high interest rates, companies have been maintaining stable margins

— S&P 500 operating margin — Risk level ■ Recession

Sources: New York Life Investments Global Market Strategy, NBER (National Bureau of Economic Research), Bloomberg, Macrobond, September 2025. The S&P 500 Index is an unmanaged index that is widely regarded as the standard for measuring large-cap U.S. stock market performance. Past performance is not a guarantee of future results. It is not possible to invest in an index.

Business input costs are not out of the woods

Sticky input prices – even before tariffs – make it unlikely businesses will be lowering prices for their customers.

Producer prices rose sharply during the pandemic, which U.S. corporations successfully passed onto customers. Now, after some relief, input prices are moving higher again, driven by services and goods costs. We expect this trend to accelerate, driven by tariffs.

The cost to hire and retain employees has normalized from highs post-pandemic. As wage growth slowed, the Employment Cost Index fell. After three years of declines, employment costs rose in Q2 2025. We are watching for signs of higher labor costs given recent immigration changes impacting labor supply.

Energy prices, reflected in the broad producer price index (PPI) visualized below, are historically volatile. In addition to demand-side disruptions from the pandemic, supply-side disruptions from conflicts in Europe and the Middle East have driven volatility. A path to peace in Ukraine could sustain recent stability.

Producer Price Index points to a gradual reacceleration in input costs, now likely to accelerate

Sources: New York Life Investments Global Market Strategy, U.S. Bureau of Labor Statistics (BLS), Macrobond, September 2025. Core Producer Price Index (PPI): total less food and energy.

Businesses' employment costs may be reaccelerating

Sources: New York Life Investments Global Market Strategy, U.S. Bureau of Labor Statistics (BLS), Macrobond, September 2025.

Energy costs have normalized after reaching new highs

Sources: New York Life Investments Global Market Strategy, International Monetary Fund (IMF), Macrobond, September 2025.

Business investment reflects a ‘tale of two economies’

Capex trends are solid, but mask meaningful sector differences.

- Tariffs have turned our outlook for capital expenditures into a ‘tale of two economies.’ At an economy-wide level, capex continues to be solid and even accelerating (**left chart**), but this masks meaningful sector differences.
- Most companies are pausing or reconsidering new capex plans as they navigate a complicated business cost and planning environment. Sectors including energy,

materials, consumer staples, and industrials have seen slower capex this year.

- Conversely, global changes appear to be boosting investment in areas that had already seen strong momentum, including AI and digital infrastructure. The combination of domestic government spending in the semiconductor supply chain, plus strong corporate and consumer interest in AI, creates a solid foundation for sustained growth.

Capex appears to have recovered...

Sources: New York Life Investments Global Market Strategy, NBER (National Bureau of Economic Research), Macrobond, September 2025.

... but masks sector divergence that strongly favors AI and digital infrastructure

Percent change in capital expenditures over the first 7 months of the year

Sources: New York Life Investments Global Market Strategy, Bloomberg, Macrobond, September 2025. It is not possible to invest in an index. Past performance is not a guarantee of future results. Each sector index comprises those companies included in the S&P 500 that are classified by the GICS® Level 1 sector of the same name. Y-axis cut off at -10%

Business debt levels and debt service show no cause for concern

Even as ultra-cheap pandemic era financing rolls off, corporate capital structures look healthy.

- Large U.S. corporations are very well capitalized, able to cover over 90% of their short-term liabilities with cash. This cash buffer was initially built with the help of very cheap financing in the pandemic era, but companies have been able to maintain this buffer even as financing costs rose.

Large companies with access to public capital markets have maintained strong short-term liability coverage

- Corporate debt-to-asset levels are back on the rise, but still near 30-year lows. Rather than accrue debt to get through the pandemic, U.S. companies benefitted from an easy financing environment and passed through inflation to consumers, allowing these firms to emerge from the pandemic with an improved capital structure. Here, too, we see no reason for immediate concern.

We see no structural debt imbalance amongst listed corporations

The fiscal outlook remains challenging

The combination of higher spending rates and higher interest rates have created a greater interest burden on federal spending.

- The average interest rate on U.S. public debt has risen to a decade high, all while U.S. government spending has ballooned. Treasury rates, which are set by the market, are impacted by the supply and demand for Treasuries. This means that higher U.S. government issuance – including issuance required to finance existing debt – impacts rates, all else equal.

U.S. debt levels - and the average price paid on that debt - are on the rise

- Between higher interest rates and growing debt levels, total interest payments have risen rapidly and now exceed the amount spent on the (previously) largest portion of the U.S. federal budget: defense. As interest payments mount, the U.S. may be forced to reduce its spending (fiscal austerity) or raise revenue (taxes) to pay down debt, or pursue higher growth (and higher inflation) policies to reduce debt burden in real terms.

U.S. interest payments on its public debt are outpacing defense spending

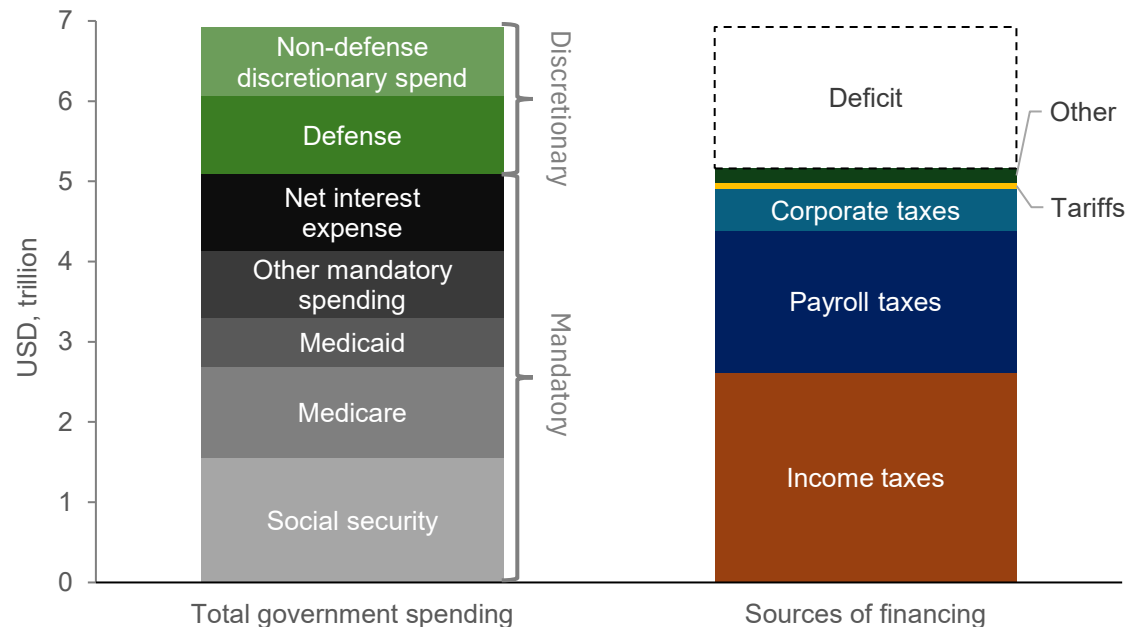

The budget deficit is set to grow, but new sources of revenue could ease the impact

The U.S. government balance sheet shows a severe imbalance, which may be modestly offset by new sources of revenue, such as tariffs.

- The U.S. budget deficit is the difference between how much money the government makes and how much it spends. Mandatory spending (vs. discretionary) accounts for most of government spending, while income and payroll taxes serve as the primary source of federal revenue. Pandemic-related spending widened the deficit significantly. It's possible the level of federal deficits will constrain Trump's policy agenda in the coming years.

- To offset spending and narrow the deficit, the administration is leaning on both conventional and unconventional revenue generating measures. Tariff revenue (paid by U.S. companies & consumers) has started to rise. The administration also announced brand-new revenue-sharing agreements with major technology companies. These deals – which include revenue sharing on chips sales to China and a U.S. government ownership stake in a rare earths company – sit in a legal gray area but are moving ahead for now.

The 2025 budget is expected to extend the deficit

Sources: New York Life Investments Global Market Strategy, U.S. Congressional Budget Office (CBO), Macrobond, September 2025.

U.S. tariff revenue is on the rise

Sources: New York Life Investments Global Market Strategy, U.S. Department of Treasury, Macrobond, September 2025.

3 International economic & market outlook

Global cycle

- [De-synchronized global growth](#)
- [Euro area](#)
- [Japan](#)
- [China](#)
- [Emerging markets ex-China](#)

Commodities & alternative currencies

- [Energy](#)
- [Metals and agriculture](#)
- [Gold and Bitcoin](#)

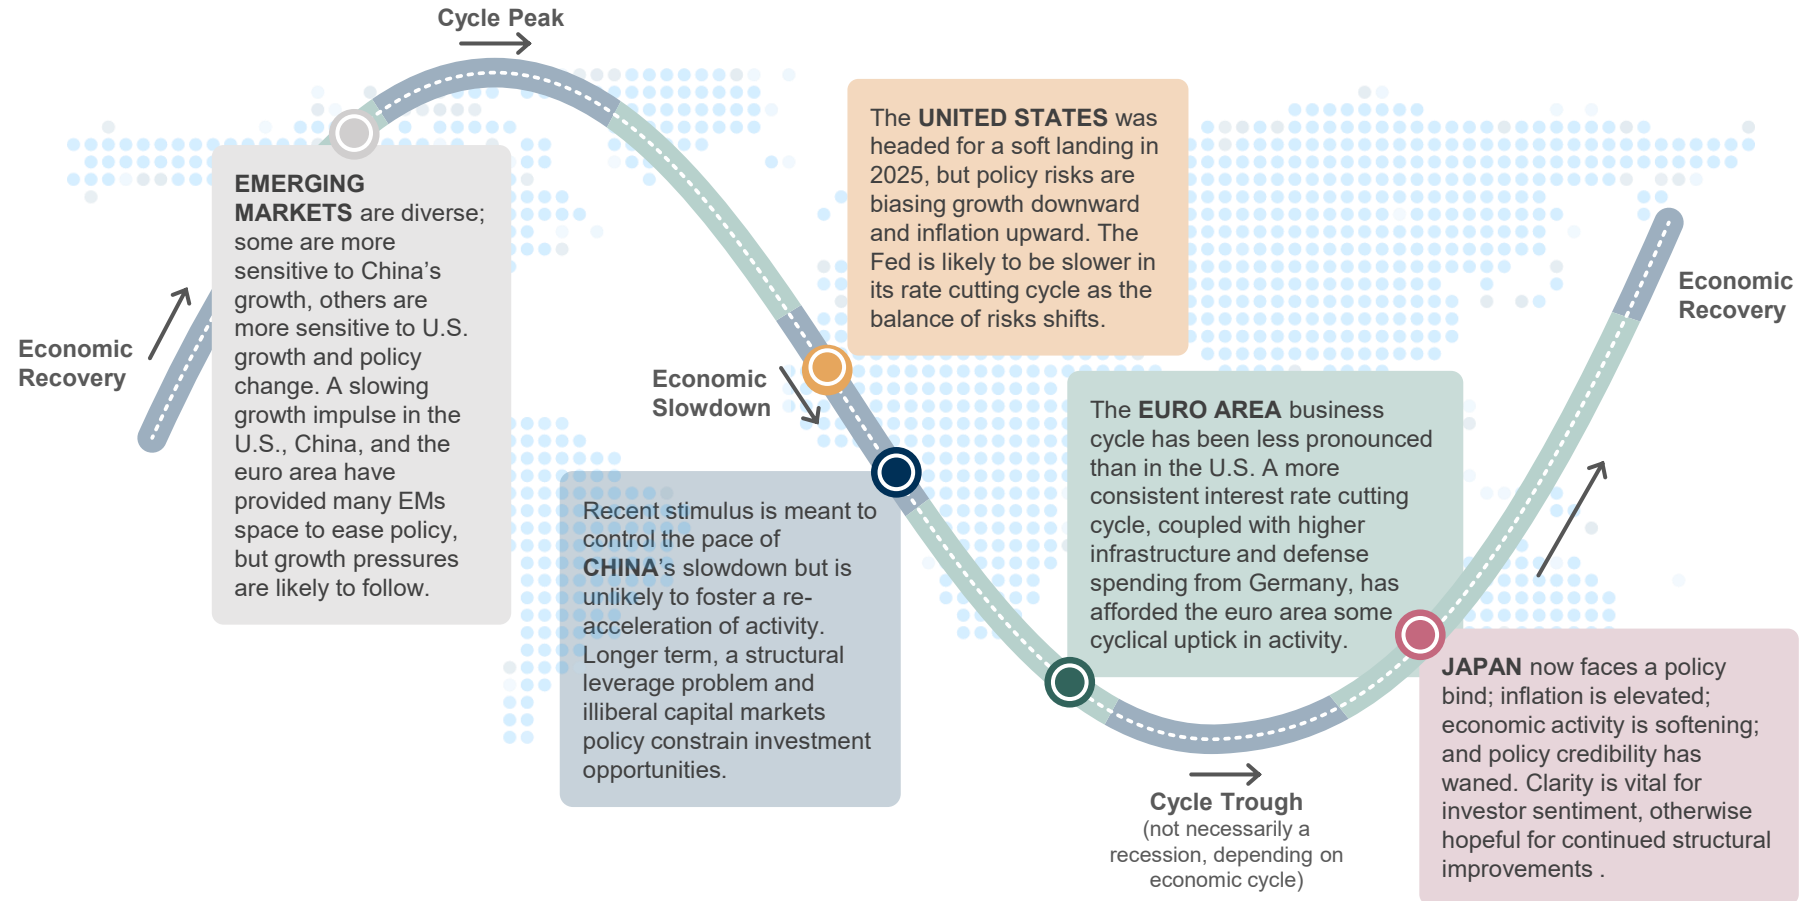

U.S. dollar

- [“Dollar Smile”: tactical dollar view](#)
- [What it takes to be a reserve currency](#)

Where are major economies in their economic cycles?

- After years of synchronized global stimulus in the post-pandemic period, growth across major economies is now diverging.
- In the U.S., shifting policy is likely to drive a 6–12 month adjustment period for both the economy and markets. In Europe, increased German defense spending has supported sentiment but is unlikely to change the near-term credit outlook. Meanwhile, Japan and China are managing structural changes that will shape their growth and investment prospects.
- Rising trade barriers pose a risk to global growth – especially in the U.S., where they could also push inflation higher. If similar policies are adopted by key trading partners, these pressures could become more widespread. We're also watching for signs that policy-driven changes in U.S. consumer behavior could slow global demand.

Major countries and regions face disharmonious economic growth dynamics and policy approaches

Sources: New York Life Investments Global Market Strategy, August 2025. For illustrative purposes only. "EM" is short for emerging markets. *The trough of an economic cycle is the lowest point in economic growth for a country during an economic cycle- A trough does not necessarily mean that there is a recession, but rather depends on the economic cycle.

Euro area

The euro area has seen more consistent interest rate cuts, extending the economic cycle. U.S. policy uncertainty is a double-edged sword.

- In the past year, easing inflation and wages (**left chart**) have contributed to a consistent ECB rate-cutting cycle. Moderate credit conditions (**middle chart**) and recovering domestic demand (**right chart**) have led to resilient outcomes. In the first half of 2025, persistent U.S. dollar depreciation and policy uncertainty also contributed to flows towards European assets.
- From an economic perspective, Europe is still at risk of disruption by global policy change. Key concerns include Europe's vulnerability to a global slowdown and the impact that a U.S.-

China escalation may have; the U.S. and China are Europe's two largest markets.

- Before the tariffs, we expected growth to slow to near 1.0% in the euro area. Now, rising uncertainty may lead European businesses to postpone their investment and hiring plans.
- Other geopolitical developments, such as resolution in the Russia-Ukraine war, stabler energy prices, and pressure to spend more on defense and infrastructure may create opportunities for the European economy.

Inflation and wage growth continue to ease

— Core inflation — Negotiated wage growth

Sources: New York Life Investments Global Market Strategy, ECB (European Central Bank), Eurostat, Macrobond, September 2025.

Normalizing policy rates have contributed to improving credit standards and loan demand

— Changes in credit standards for businesses — Business loan demand

Sources: New York Life Investments Global Market Strategy, ECB (European Central Bank), Macrobond, September 2025.

Domestic demand improved as rates moved lower

— Euro Area GDP

Sources: New York Life Investments Global Market Strategy, Eurostat, Macrobond, September 2025.

TAKEAWAY: A consistent interest rate cutting cycle have contributed to cyclical improvements in credit availability and consumer demand. At the same time, U.S. policy uncertainty has contributed to higher appetite for European assets on the margin. The business backdrop is more cautious; U.S. tariff uncertainty and competition from China loom large.

Japan

Domestic and global policy disruptions likely put the Bank of Japan on pause for the rest of this year.

- While most global central banks were raising rates from 2022-2024, the Bank of Japan maintained accommodative monetary policy. This has now reversed. A weaker yen spurred import-price inflation, contributing to higher wages for the first time in many years (**left chart**).
- In response, the Bank of Japan (BOJ) loosened yield curve control, ended negative interest rate policy in April 2024, and hiked rates to 0.5% in Jan 2025 (**right chart**). Market financial conditions, including equity market valuations, have tightened considerably in response.

Negotiations lead to steepest wage increases in 30 years

- Spring wage negotiations, salary increment, weighted average
- Headline consumer price index (CPI)

Sources: New York Life Investments Global Market Strategy, Japanese Trade Union Confederation (RENGO), Japanese Statistics Bureau, Ministry of Internal Affairs & Communications, Macrobond, September 2025.

Higher inflation has led to loosening yield curve control and an end to negative interest rate policy

- Yield on 10-year Japanese government bonds

Sources: New York Life Investments Global Market Strategy, Macrobond Financial AB, Bank of Japan (BOJ), Macrobond, September 2025.

TAKEAWAY: In recent years, Japanese policymakers made meaningful efforts towards renewed global competitiveness. Changes in global conditions – including U.S. tariffs – now muddy the waters. We are closely watching recent developments in the semiconductor supply chain, which could position Japan as an incremental chip manufacturing location and therefore increase capital investment.

China's structural story: a structural deceleration in growth

A deleveraging problem and illiberal capital markets policy are likely to constrain investment opportunities in China over the medium term.

China's decades of high growth have been fueled by high leverage

Sources: New York Life Investments Global Market Strategy, People's Bank of China (PBoC), BIS (The Bank for International Settlements), China National Bureau of Statistics (NBS), Macrobond, September 2025. GDP: Nominal.

- In the past several decades, credit expansion— through formal banking, shadow banking, infrastructure, and real estate – has been utilized to mitigate cyclical slowdowns, with diminishing returns (**left chart**).
- Recent years' policies seem to acknowledge that the high-leverage model is unsustainable: shadow lending had slowed, Chinese real estate giant Evergrande was allowed to fail, and local and central government growth targets have been periodically relaxed.
- On a structural basis China also needs to cope with its export-led growth model and has signaled its intent to foster greater domestic consumption. Foreign portfolio inflows could ease this transition away from export-led inflows, but we see little impulse to liberalize markets.

China's regulation has hampered value creation in equities

Sources: New York Life Investments Global Market Strategy, Bloomberg Finance LP, MSCI, Macrobond, September 2025. BATs: Chinese tech giants listed outside China's onshore markets: Baidu, Alibaba, and Tencent. Onshore markets represented by Shanghai Composite, comprising all A and B shares listed in Shanghai. MSCI China: large and mid-cap representation across Shanghai and Shenzhen.

- China's closely regulated onshore equity markets do not include exposure to major tech firms, including the BATs: Baidu, Alibaba, and Tencent, which operate within China but are listed primarily in the U.S. (**right chart**). Lack of onshore exposure to these names enabled China's infamous tech crackdown of 2021, where harsh new regulations and fines against these firms destroyed over \$1T in market cap for U.S.-listed China indexes.
- While China made decades of great strides to liberalize its capital markets, recent years have seen a slew of anti-investor regulation that has harmed market confidence in the country.
- Other structural issues on our radar: demographics, productivity, intellectual property protection.

TAKEAWAY: China remains the world's #2 economy and trade power, and in this sense continues to be a “must have” in a diversified international allocation. However, the country's proclivity for avoiding economic growth slowdowns with the use of leverage, paired with wavering investor-friendly policies, make us cautious on the medium-term outlook.

China's cyclical story: managing internal and external pressures

China's stimulus is not meant to spark an economic acceleration, possibly to the detriment of key emerging markets trading partners.

- This cycle and on a structural basis, China uses monetary policy to counterbalance the real estate market, in part by reducing required reserve holdings by banks to encourage lending when real estate is in contraction (**left chart**). Given the extent of real estate recession in China, we believe this stimulus is meant to control the extent of total economic slowdown rather than foster an outright economic acceleration. In 2025, Chinese growth is expected to slow from 5.0% YoY to 4.5%.

China is countering the real estate crash with easier monetary policy

— Reserve requirement ratio, large banks, right axis

■ Completed investment in real estate, left axis

Sources: New York Life Investments Global Market Strategy, China National Bureau of Statistics (NBS), People's Bank of China (PBoC), Macrobond, September 2025. Lower reserve requirement ratio indicates that banks are required to hold fewer reserves, incentivizing them to lend; this is a form of monetary policy stimulus.

- Now, China must also contend with trade tension with the U.S. Reduced foreign inflows from exports are likely to pressure China's GDP growth to some degree; tariff work-arounds remain to be seen, but it is constructive that the worst-case prohibitively high tariffs are off the table.
- We may not see this direct impact for several quarters still, but are monitoring how shifting trade relationships affect China's trade relationships with Brazil, Mexico, and others (**right chart**).

We are monitoring a wide variety of Chinese trade relationships to capture tariff impact

— U.S. — Japan — Australia — Europe — Russia — Mexico — Vietnam — Brazil

Sources: New York Life Investments Global Market Strategy, Bloomberg Finance LP, Customs General Administration of the People's Republic of China, Macrobond, September 2025.

Emerging markets

Emerging markets are benefitting from the move toward global diversification and a weaker dollar but likely face trade-related growth risks.

Emerging market economic activity remains solid overall, but cycles are heterogenous

Sources: New York Life Investments Global Market Strategy, S&P Global, China Federation of Logistics & Purchasing, Taiwan National Development Council, Bureau for Economic Research of South Africa (BER), Macrobond, September 2025.

A weaker dollar helps Emerging Markets keep policy accommodative

■ Percentage point change in policy rate since Jan 2024

Sources: New York Life Investments Global Market Strategy, Federal Reserve, ECB (European Central Bank), Macrobond, September 2025.

TAKEAWAY: Emerging markets are heterogenous but historically struggle to overcome growth pressures from developed markets. Investors should be sensitive to the earnings and valuation outlooks in each market or should consider a holistic hedging strategy to counter broad-based EM currency weakness in periods of slowing global growth (for more, [see asset class insights](#)).

Global energy costs have largely normalized, but upside risks remain

Shocks related to the pandemic and invasion of Ukraine have settled, leaving global energy prices broadly balanced.

Oil prices have normalized after the post-pandemic period and invasion of Ukraine

Sources: New York Life Investments Global Market Strategy, Bloomberg Finance LP, Macrobond, September 2025.

Natural gas has similarly normalized from its 2022 spike

Overall energy futures are at their lowest point in over 30 years

Sources: New York Life Investments Global Market Strategy, Bloomberg Finance LP, Macrobond, September 2025. Past performance is not indicative of future results. It is not possible to invest directly in an index. Bloomberg Energy Subindex is composed of futures contracts on crude oil, heating oil, unleaded gasoline and natural gas.

Other commodities have unique drivers

Geopolitical factors from central bank gold-buying to war-related disruptions are prompting major commodities to adjust to “new normal” levels.

Gold has led precious metals strength, benefitting from both commercial uses as well as a structural wave of central bank buying as actors such as Russia, China, and Iran built up greater gold reserves.

Industrial metals have benefitted from long-term investment themes, including infrastructure supporting energy independence and the digitization (AI) boom.

Agriculture futures were driven by higher grain prices after the invasion of Ukraine (Ukraine is one of the world’s largest producers of wheat and corn). Ukrainian grain exports are down today relative to their pre-war levels, but they have not ceased outright, supporting normalization in the agricultural commodities price index.

Precious metals futures, driven by strong gold demand, sit at historic highs

It is not possible to invest directly in an index. Bloomberg Agriculture Subindex composed of futures contracts on coffee, corn, cotton, soybeans, soybean oil, soybean meal, sugar and wheat.

“Currencies” beyond the U.S. dollar

Gold and Bitcoin represent disparate approaches for how investors can consider diversifying outside the traditional public capital markets.

- We see gold as a “risk-off” diversifier. In addition to successfully hedging inflation over the long term, gold is benefitting from global central bank purchases and industrial uses.

Gold is a proven inflation hedge over the very long term

Sources: New York Life Investments Global Market Strategy, Macrobond Financial AB, U.S. Bureau of Labor Statistics (BLS), Macrobond, September 2025.

- Bitcoin, by contrast, is a “risk-on” diversifier; cryptocurrency is a risk asset with volatility to match. Bitcoin has seen stellar price performance post-pandemic, benefitting from broader retail participation in the wake of cryptocurrency ETF creation and pro-cryptocurrency policies from the Trump administration. However, it is highly sensitive to changes in liquidity and market momentum.

Bitcoin's daily volatility has calmed as investor participation broadens, but is still incredibly high

Sources: New York Life Investments Global Market Strategy, Macrobond Financial AB, Macrobond, September 2025.

Our framework for thinking about U.S. dollar moves

Relative global growth and relative global monetary policy create a high degree of uncertainty for the near-term direction of the U.S. dollar.

We use a “dollar smile” framework to anticipate currency regime

Opinions of New York Life Investments Global Market Strategy, September 2025. For illustrative purposes only

The dollar smile

- We see the strength or weakness of the U.S. dollar as a key source of risk for international exposure. One useful framework for analyzing the dollar is the “dollar smile” (**chart**). In moments of low liquidity (such as a crisis or recession), or when U.S. economic growth outperforms, the dollar is likely to be stronger. When liquidity and global growth are ample, the dollar tends to weaken.

Where is the dollar on the smile?:

- The dollar strengthened in the post-pandemic period as U.S. economic growth, supported by large fiscal and monetary stimulus, began to far outpace that of other countries.
- Today the dollar is sitting at the bottom of the dollar smile as the market prices in faster growth outside of the U.S., or relatively slower growth from the U.S.
- However, pressure isn’t only downward on the USD. Tightening USD liquidity from heavy T-bill supply soaking up cash is also likely adding upward pressure on the dollar.

What’s next for the U.S. dollar?

- In a phrase: rangebound and volatile. The dollar index (DXY) is likely to bounce between the 100 and 96 levels.
- For the dollar to weaken from here, we would likely need to see clearer signs of slowing growth in the U.S. Upside growth surprises would support dollar firming, in our view.
- Tariffs, on their own, increase the relative strength of the dollar, however, capital flows out of the U.S. have placed downward pressure on the dollar’s relative value.
- Rate cuts from the Fed may also reduce the USD’s attractiveness relative to other currencies in the short term, though rate differentials still favor the USD.

TAKEAWAY: The dollar has weakened, but we see risks as roughly balanced for now. Still, strong opposing forces – tariffs pushing up and growth concerns pulling down – point to continued volatility. Investors with global exposure can consider a currency hedged strategy.

Dollar dominance: the U.S. dollar remains chief of all reserve currencies

The Chinese renminbi in particular does not yet meet the criteria for reserve currency status, and is unlikely to pose a threat to dollar dominance.

REQUIREMENTS FOR A GLOBAL RESERVE CURRENCY				
REQUIREMENT	 U.S. DOLLAR	 EUROPEAN EURO	 JAPANESE YEN	 CHINESE RENMINBI
Trust in the central bank <i>Share of global FX reserves</i>	57%	20%	6%	2%
Liquidity <i>Foreign holding of government debt</i>	35%	38%	30%	9%
Broad acceptance <i>Share of foreign currency debt issuance</i>	64%	24%	3%	1%
Convertibility <i>FX transaction volume</i>	45%	16%	9%	4%
Open capital account <i>Capital controls</i>	None (Open)	None (Open)	Some (Restrictions)	Tight (Closed)
Floating exchange rate regime <i>Exchange rate regime</i>	Floating	Floating	Managed (Yield curve control)	Managed (against a basket of currencies... including the U.S. dollar!)

Sources: New York Life Investments Global Market Strategy, Federal Reserve, Bank for International Settlements (BIS), International Monetary Fund, September 2025.. FX refers to foreign exchange. The Chinese currency can be referred to interchangeably as the renminbi or the yuan. BIS data: Drehmann, Mathias, and Vladyslav Sushko. "The Global Foreign Exchange Market in a Higher-Volatility Environment." BIS Quarterly Review, Bank for International Settlements, 5 Dec. 2022, https://www.bis.org/publ/qtrpdf/r_qt2212f.htm

TAKEAWAY: Dominating global reserves, transactions, and global debt, the USD is set to remain the world's primary reserve currency. China's capital controls and lack of global convertibility and transactability make it unlikely for RMB influence to expand beyond select commodity-based trade relationships.

Dollar dominance: only innovation can unseat the USD

Real disruptive potential comes not from competitor currencies, but innovation.

The USD still dominates global finance

Share of global currency reserves

Sources: New York Life Investments Global Market Strategy, Macrobond, September 2025.

- What could truly pose a threat to the vast scale of USD dominance (**left chart**)?
- History tells us that a combination of innovation and global conflict have been the catalysts for currency regime change (**table**). It is not a country's rise in importance, but rather the emergence of a new and more efficient system, that has initiated past currency transitions. Digital currencies could be the next such innovation to disrupt today's currency regime.

DOMINANT CURRENCY	MAINSTREAM VIEW FOR DOMINANCE	INNOVATION CATALYST
Venetian ducat (12th century–16th century)	The Fourth Crusade and other medieval military conflicts	Gold standard, minting and navigation technology
Spanish dollar (16th century–1800)	Spanish Armada's defeat of the English navy in 1588	Mining and transportation technology
British pound (1815–1920)	The Seven Years' War and the Napoleonic Wars	Steamship industry expansion
U.S. dollar (1920–?)	WWI, WWII	Early adoption of telegraph, federal reserve system, development of aviation industry

TAKEAWAY: Though countries like China are increasing in global geopolitical importance, it is not a single country's rise that displaces a currency – at least in historical terms. Instead, we expect the U.S. dollar system would be more likely to be replaced when a more efficient alternative to fiat currencies – such as a global digital currency system – were to emerge.

4 Long-term themes

Insights

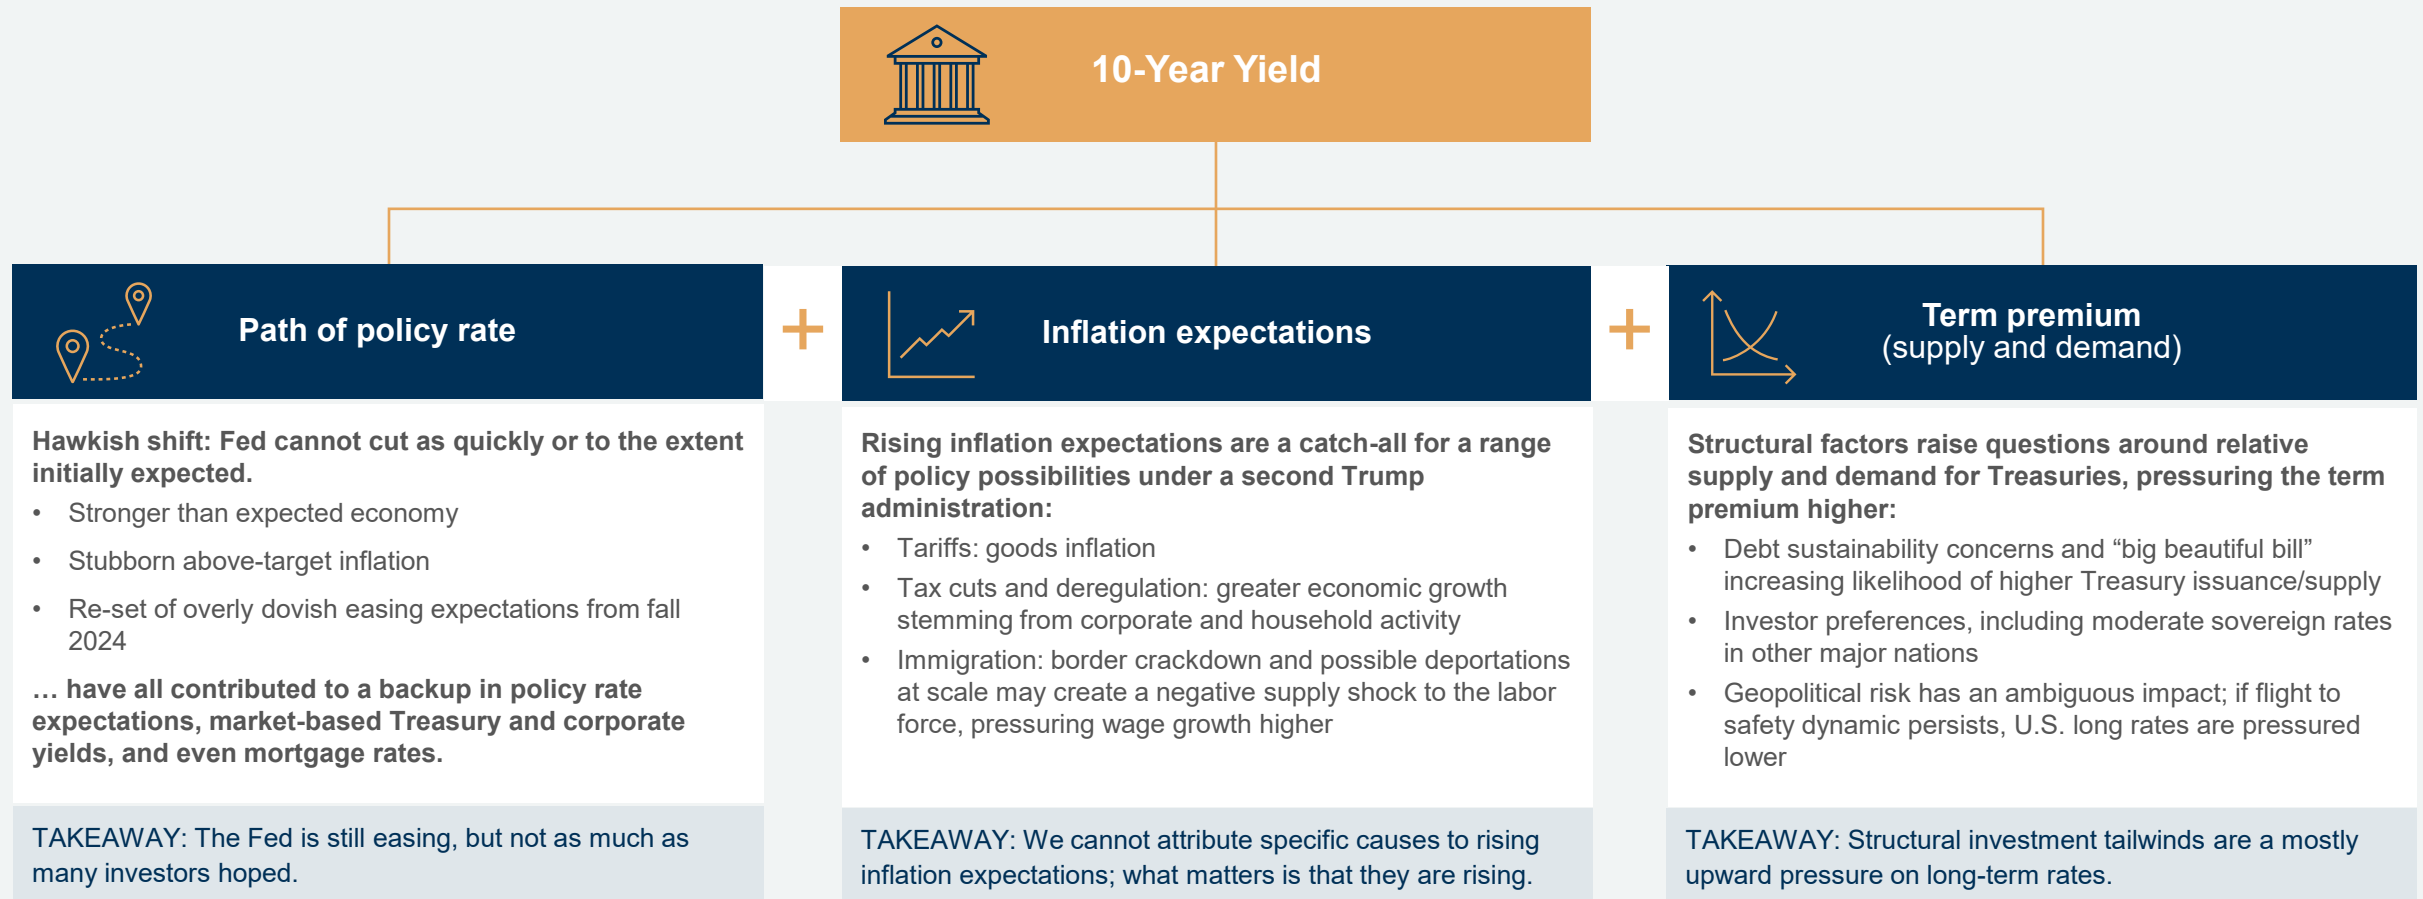

- [Long-term interest rates](#)
- [Sovereign debt sustainability](#)

Global megatrends

- [Geopolitical risk](#)
- [Supply chains and capital intensity](#)
- [Artificial intelligence and digital infrastructure](#)

What is driving volatility in long rates?

The “Trump trade” and structural factors are pressuring long rates higher, while questions around the growth outlook pressure them down.

Opinions of New York Life Investments Global Market Strategy, September 2025.

Global debt sustainability: sovereign spending can increasingly influence allocation

Higher public debt levels are associated with slower growth, higher interest rates, and higher inflation.

Many developed economies feature a troubling sovereign debt trajectory

Sources: New York Life Investments Global Market Strategy, International Monetary Fund (IMF), Macrobond, September 2025.

- In the post-war era, demand for sovereign debt has generally been strong and sovereign defaults have been increasingly rare – a dynamic all the more notable given ever-rising global debt levels, periods of very high interest rates, and seismic political-economic shifts throughout this time period,
- Underpinning debt sustainability is a symbiotic relationship between the federal debt of the United States and global savings: U.S. Treasuries offer a moderate, risk-free yield that has become a sink for the excess savings of other countries. In the last 20 years in particular, the relationship between Treasuries and savings has enabled and benefited from globalization: as the world has integrated, demand for the reserve currency has broadened.

Debt management choices can drive allocation decisions

- Of the traditional paths an economy can take to manage sovereign debt, outside of default and assistance from multilateral institutions, we see four with the clearest impacts on country-level allocation and, by extension, relative geographic investor preference:
- Austerity: less government spending can create a risk-off market environment, with pressure on growth, interest rates, and inflation.
- Pro-growth spending: greater government spending can be a boon to an economy if spending is productive, pushing the growth rate above the rate of interest owed on debt. This can promote a risk-on market environment; selection in private markets is key if the growth backdrop supports public asset class returns.
- Financial repression: the debt management period common to the U.S. and UK post-WWII, financial repressions allows inflation to run hot, eroding the real (inflation-adjusted) value of debt. Inflation hedges, from gold to real assets, become critical in such an environment.
- Financial engineering: central bank and finance ministry/Treasury department intervention compresses interest rates, prompting an investor focus on income generation.

TAKEAWAY: We see more opportunities for sovereign debt management to influence long-term asset allocation decisions. Globally, we see an increasing tolerance of higher debt and moderately higher inflation and interest rates, all in the name of supporting economic growth. Examples of U.S. and European debt sustainability are explored in the following pages.

U.S. sovereign debt requires some near-term solutions, but is structurally robust

The U.S. must address its acute interest burden problem, but other determinants of debt sustainability are healthier than many investors realize.

- What allows the U.S. to carry an over 100% debt-to-GDP ratio: *exorbitant privilege*. With the U.S. dollar as the world's dominant reserve currency and the world's deepest capital markets, the U.S. can carry and finance more debt than other advanced economies thanks to structural demand for Treasuries and dollar-denominated assets.

Applying our sovereign debt sustainability framework

- U.S. debt sustainability has two Achilles heels. First, interest expense on the national debt is rapidly becoming unaffordable, growing exponentially due to both higher financing costs and a larger stock of debt. Second is a recent, dramatic deterioration in **policy credibility**. Both threaten U.S. exorbitant privilege.
- However, the other pillars of U.S. debt sustainability look healthy. Its **capital markets** remain the deepest and most liquid in the world. It has a **healthy mix of foreign and domestic ownership of its debt**, and its **central bank** provides a selective rather than sustained demand backstop. **Private sector investment** is robust; today's policy uncertainty notwithstanding.

The path forward

- We do not expect a U.S. sovereign default in the foreseeable future because of the enormous depth of U.S. capital markets relative to those of other highly indebted countries.
- We do not believe austerity is politically feasible in the U.S.; we see greater inclination for the government to invest *more* in structural spending areas (below), in the aim of supporting a growth rate that exceeds the interest burden.

We expect the following areas to dominate the next years of U.S. spending:

- Energy: traditional and green
- Digital infrastructure, from electric vehicles to data centers
- Power grid infrastructure to fuel generative artificial intelligence
- Defense, including cyber defense
- Health, including on an aging population

U.S. debt sustainability framework

Source: New York Life Investments Global Market Strategy, September 2025. For illustrative purposes only.

European debt sustainability dynamics may shift as the continent invests in itself

Recent tolerance of greater debt to finance domestic investment is promising, but fragmented capital markets may cap this progress.

- Though its individual members have taken heterogeneous approaches to debt management, Europe as a whole has the most fiscal space of the major economies – and is starting to show a willingness to use it.
- Germany's recent move to relax fiscal rules in favor of greater infrastructure and defense investment may, in hindsight, be recognized as a sea-change in Europe's attitude toward fiscal austerity, domestic investment, and tolerance of inflation.

Applying our sovereign debt sustainability framework

- Use of austerity to manage debt crises in Europe has been effective – overall debt levels are manageable; **interest burdens** are affordable; and the countries affected by the 2011 crises now see some of the fastest growth in the region.
- However, austerity has had the painful side effects of lower economic growth and chronic underinvestment. We expect to see a continued, gradual shift toward greater infrastructure, defense, and technology spending, requiring a greater tolerance for inflation.
- Europe faces one obstacle that detracts from its **policy credibility, capital markets depth and liquidity, demand mix** for its sovereign debt, and **private sector productivity**: the incredible legal, financial, and political difficulty of integrating its capital markets.
- This fragmentation has contributed to crises of confidence that have been resolved by strong **central bank** leadership (Mario Draghi's "whatever it takes" moment) and severe policy adjustments (the Greek economy shrunk by a quarter amid post-2011 austerity).

The path forward

- Like the U.S., we see European countries inclined to accelerate their pace of spending in a growth-supportive manner, departing from the region's legacy of austerity.

Europe's debt sustainability framework

Source: New York Life Investments Global Market Strategy, August 2025. For illustrative purposes only.

Navigating the new geopolitical order

The end of U.S.-led globalization is reshaping markets and strategy.

- We believe the U.S.-led world order, which took hold in the early 1990s and peaked around 2010, has been gradually giving way to a return of great power politics (**right chart**) defined by economic nationalism, strategic industrial policy, onshoring, and the weaponization of trade, technology, and financial systems. This regime change has far-reaching implications for capital flows, inflation, and portfolio construction.
- The end of the Cold War world order was abrupt, driven by the collapse of the Soviet Union. The rise of great power politics has been more gradual, shaped by economic competition, shifting alliances, and regional rivalries.
- Though recent U.S. policy positions may have accelerated this regime change, the broader trend is about more than one country or one administration. The global economic landscape has shifted in stages: as free trade and open markets became more entrenched; as the beneficiaries of those economic ideas ebbed and flowed; and as policymakers' tools and preferences changed.

Globalization peaked alongside the U.S.-led world order

Trade openness: sum of global exports and imports as a percent of world GDP

Sources: New York Life Investments Global Market Strategy, International Monetary Fund (IMF), United Nations Trade & Development, Macrobond, September 2025.

The principles of the U.S.-led world order are giving way to...

...the principles of great power politics

Globalization

Economic nationalism

Free trade

Weaponization of trade and finance

Market liberalization

Preference for bilateral relations over multilateral institutions

Multilateral institutions

Strategic competition; emphasis on industrial policy

Efficiency over resilience

Resilience over efficiency

Results

Countries increasingly pursue onshoring, reshoring, strengthening their own domestic industries.

Sanctions, tariffs, and financial restrictions are deployed more frequently as instruments of geopolitical pressure, especially by the United States.

Governments move away from multilateral agreements and institutions – such as the Trans-Pacific Partnership and the WTO – in favor of bilateral negotiations that prioritize national interests.

Governments direct investment into strategic sectors to bolster industrial capacity and national competitiveness.

Countries reconfigure supply chains to emphasize resilience and redundancy, marking a shift away from cost-optimized globalization.

How can investors account for geopolitical risk?

Investors can consider a range of investment approaches for the return of great power politics.

- Regime change from a U.S.-led world order to great power politics carries significant implications for global economic organization and policy decision-making.
- In an era defined by great power politics, investors should focus on protecting portfolios from inflation and political volatility by prioritizing real assets, commodities, infrastructure, and resilient (or beneficiary) sectors.

Theme	Approach	Investment idea
Incidence of geopolitical risk appears to be rising	→ Add a macro volatility satellite to portfolio	→ Equal parts oil, gold, and bitcoin, implemented as a small satellite exposure sourced from equity
Event risk can impact any country or region	→ Diversify country exposure	→ The benefits of diversifying country exposure are likely to grow as globalization weakens and national economic trajectories diverge
	→ Manage currency risk	→ Consider a 50% currency hedge as currency volatility is likely to be higher
Regime change / Event risks are more likely to become paradigm shifts	→ New world order is likely to push prices and rates higher	→ <i>Manage duration</i> : we prefer short duration exposure or, when extending duration, keeping a close eye on income generation per unit of interest rate volatility <i>Add inflation-aware asset classes</i> : TIPS, real assets <i>Build income across asset classes</i> : Dividend-paying equities; high-yield corporate bonds
		→ <i>Private assets</i> : Focus on areas of real value creation. We favor the lower middle market as an area more resilient to global changes and capital markets trends, especially as dry powder has been captured upmarket
	→ Economic nationalism is becoming more evident	→ <i>Overweight domestic champions and beneficiary sectors</i> : industrials, energy, semiconductors, cybersecurity, and defense
		→ <i>Capture global megatrends</i> : Digital and energy infrastructure may benefit from the confluence of geopolitical trends and global economic needs (e.g. artificial intelligence).
	→ Market risk is more politically-driven and non-economic	→ Active management tends to outperform during periods of higher volatility. Investors should consider actively managed funds to better target quality opportunities in equities and credit.

Opinions of New York Life Investments Global Market Strategy, September 2025.

Global megatrends: creating persistent demand for capital

Innovation in geopolitics, energy needs, and innovation are fueling real economic activity, driving investment opportunity.

- A powerful combination of global economic and geopolitical events – the COVID-19 pandemic, the resulting inflation wave, the increasing visibility of climate change, Russia's invasion of Ukraine, the rapid rise in computing power of semiconductors — has rapidly changed the global economic model. Efficiency of supply chains is no longer as important as the security of, and persistent access to, key materials.
- We believe that the combination of national interest (public funding), corporate leadership (capital expenditure), and universal application (household interest) in these trends will result

in durable investment.

- For the next few years, these transitions are likely to be highly capital intensive. More materials will be required, promoting potentially higher prices for those materials, and contributing to our conviction that inflation and interest rates are likely to be higher and more volatile.
- These transitions may also drive policy changes. Stickier inflation, alongside a strategic demand for capital investment, may encourage central banks to re-consider their inflation targets.

AI's additional power requirements are extensive

Data center electricity use

Sources: New York Life Investments Global Market Strategy, Macrobond, International Energy Agency, CBRE Investment Management, European Commission, China's State Council, Japan Science and Technology Agency, S&P Global, U.S. Energy Information Administration, June 2024. TWh = terawatt hours of electricity

Global resource production for key technologies is highly concentrated

Share of raw materials: top producer for each commodity

Sources: New York Life Investments Global Market Strategy, U.S. Geological Survey, International Energy Agency. Data as of 2021.

Global megatrends: AI is sparking sustained capital reallocation

Investment opportunities are likely to be concentrated in three underpinning layers of AI.

Digital infrastructure

Chips, data centers, power

- Data centers' computation and cooling needs are expected to drive astonishing increases in electricity demand.
- Some past innovation waves, such as electric vehicles, did not see a timely infrastructure buildout. We believe AI has three critical ingredients for a successful infrastructure timeline:
 - Public funding: the \$300B U.S. CHIPS Act is just one national initiative to support tech infrastructure, mirrored by many other countries.
 - Corporate leadership: Magnificent 7 firms are footing the bill for development of GenAI models and proprietary infrastructure.
 - Universal application: with over 100M weekly users, ChatGPT alone shows the enthusiasm behind GenAI that is necessary to support allocation of resources toward this innovation.

AI has daunting infrastructure requirements, but we believe they will be achieved.

Foundational models

Data, model creators, cloud

- Up to this point, investment hype around AI has been concentrated around the major AI model providers. GenAI models are expensive and onerous to create, requiring high-quality data, time to train models, and a specialized talent pipeline.
- As AI adoption and use-cases broaden, we see competition reaching foundational model providers. This competition may come from new entrants creating large models, or from large corporations creating in-house models.
- Greater competition among model providers should lower costs for corporate users of AI, in turn fostering even broader adoption.

As AI use-cases expand, expect more competition among GenAI model providers to lower costs for AI users.

Corporate application

Software, services, use case exploration

- Companies looking to leverage AI face classic cost and corporate strategy tradeoffs, but there are areas of uncertainty in the early days of AI that will require specific attention and capital allocation:
- Ethical AI: we believe companies willing to leverage strong corporate governance toward a robust responsible AI framework will see a return on that investment.
- Regulation: regulation has not yet caught up with AI in the U.S., creating a cheaper but more uncertain operating environment.
- Competition: at the corporate and national level, and AI arms race may foster both rivalry and cooperation.
- Labor policy: we see AI creating a net upskilling effect for the labor force rather than mass unemployment, as jobs move from execution to monitoring and compliance.

Companies will not only need to allocate capital to AI use cases, but also to buffer against regulatory uncertainty.

Today's equity risk premium suggests bonds may outperform stocks in the long run

Understanding the equity risk premium as a long-term indicator of equity outperformance.

The U.S. equity risk premium is a weak indicator of one year excess performance of stocks over bonds...

Individual dots represent months, data from 1980

Sources: New York Life Investments Global Market Strategy, Shiller, Macrobond, September 2025. R-squared quantifies how much of the variation in the dependent variable is explained by the independent variables in a regression model. CAPE: cyclically adjusted (for inflation) price-to-earnings ratio.

...but a much strong predictor over a 10-year horizon

Individual dots represent months, data from 1980

Sources: New York Life Investments Global Market Strategy, Shiller, Macrobond, September 2025. R-squared quantifies how much of the variation in the dependent variable is explained by the independent variables in a regression model. CAPE: cyclically adjusted (for inflation) price-to-earnings ratio.

- The equity risk premium measures the difference between the expected return from equities (the earnings yield or inverse of the price-to-earnings ratio) and the risk-free return (typically the U.S. 10-year Treasury yield). A low or negative equity risk premium implies that equities are potentially overvalued relative to bonds, suggesting a lower likelihood of equities outperforming bonds.
- As a predictor, the equity risk premium has historically done a weaker job on a short-term time horizon. There is virtually no relationship between the equity risk premium and one-year ahead returns suggesting equity risk premium is a weak predictor of year ahead returns (**left chart**).
- However, over a 10-year horizon, the equity risk premium has historically been a much better predictor of future returns (**right chart**). Based on historical experience, today's equity risk premium would point to an annualized 10-year real outperformance of stocks over bonds of roughly 1.5%. This says to us that there is more risk to buying equities at these levels and outperformance of stocks over bonds is challenging in this environment.

TAKEAWAY: Based on current market valuations and interest rate levels, expecting stocks to significantly outperform bonds over the next decade might be overly optimistic.

The outlook for corporate earnings is still positive in the face of growing risks

Earnings growth has held up, but cooling demand and policy uncertainty raise risks.

Corporate profit margins are the next domino to fall: they may appear resilient but there is a wide dispersion between sectors

Sources: New York Life Investments Global Market Strategy, NBER (National Bureau of Economic Research), Macrobond, September 2025.

Strong earnings have justified lofty valuations and stellar price performance

Sources: New York Life Investments Global Market Strategy, S&P Global, Macrobond, September 2025. EPS: Earnings per share. The S&P 500 Index is an unmanaged index that is widely regarded as the standard for measuring large-cap U.S. stock market performance. It is not possible to invest in an index. Past performance is not a guarantee of future results.

- Equity markets are priced based on earnings and multiple expansion (or contraction), with multiples being influenced by factors such as cost of capital and investor sentiment.
- Corporate earnings have remained resilient in the face of increasing risks. Profit margins appear resilient (**left chart**) but there is a wide dispersion between sectors with tech seeing the most strength. Today, the market is still optimistic about earnings growth. Market pricing suggests earnings per share (EPS) are expected to grow by 9% in 2025 and 14% in 2026. For context, EPS rose by 13% in 2024 and nudged up by only 0.5% in 2023, which was also a period of very strong economic activity. While risks remain, we believe the market could achieve its 9% earnings growth expectation, provided the economic backdrop doesn't materially deteriorate.
- How much of a selloff should investors expect if earnings growth came into question? In a typical earnings-related selloff, based on the past 16 recessions (excluding the Covid recession), the median draw down in real EPS is 21%. In 2022, the S&P 500 experienced an 25% drawdown when investors began to doubt corporate resilience (**right chart**). But in this case, performance rebounded - profits were ultimately boosted by business and wage supports, as well as lower rates locked in from the years of easy monetary policy. If earnings don't expand further from here, investors hoping for higher equity valuations would be left to rely on multiple expansion via falling rates and improving confidence.

TAKEAWAY: Stable corporate earnings have provided support for equity performance; however, inflation and margin compression remain a risk for many of these companies. Investors are pricing in strong earnings growth, but we remain cautious as companies prepare for a volatile trade and policy environment.

Equity valuations: no bargains yet

Recent market volatility, driven by geopolitical tensions and trade policy uncertainties, has impacted equity valuations but the market isn't cheap.

The S&P 500 is trading above its long-term average

Sources: New York Life Investments Global Market Strategy, NBER (National Bureau of Economic Research), Macrobond, September 2025. The S&P 500 Index is an unmanaged index that is widely regarded as the standard for measuring large-cap U.S. stock market performance. It is not possible to invest in an index. Past performance is not a guarantee of future results.

Most S&P 500 sectors are trading above their long-term medians

Sources: New York Life Investments Global Market Strategy, Bloomberg, Macrobond, September 2025. It is not possible to invest in an index. Past performance is not a guarantee of future results. Each sector index comprises those companies included in the S&P 500 that are classified by the GICS® Level 1 sector of the same name.

TAKEAWAY: After the market rally that has priced out most policy risk, U.S. equity valuations remain above their long-term averages. We expect valuation multiples to see increased volatility as the macro environment remains uncertain.

Growth is outperforming again in the U.S.; value dominates elsewhere

Value indexes are also less concentrated than growth indexes suggesting a greater level of resilience amidst policy uncertainty.

The post-pandemic era hasn't yet proven more supportive of value equities

Source: New York Life Investments Global Market Strategy, Bloomberg, Macrobond, September 2025. The Russell 1000 Growth Total Return Index measures the performance of large-cap growth-oriented stocks in the U.S. market. The Russell 1000 Value Total Return Index measures the performance of large-cap value-oriented stocks in the U.S. market. It is not possible to invest in an index. Past performance is not a guarantee of future results.

Growth equity outperformance has been a U.S. story

Sources: New York Life Investments Global Market Strategy, S&P Global, Macrobond, September 2025. U.S. growth and value equities are represented by the S&P 500 Index which is an unmanaged index that is widely regarded as the standard for measuring large-cap U.S. stock market performance. Non-U.S. growth and value equities are represented by the EAFE index which is a free-float weighted equity index covering DM countries in Europe, Australasia, Israel, and the Far East. It is not possible to invest in an index. Past performance is not a guarantee of future results.

TAKEAWAY: Value stocks are trading at a wide discount to growth equities, offering attractive entry points. Still, with growth outperforming in 14 of the past 20 years, we're not dropping growth equities altogether and believe a balanced approach remains key.

Dividend-paying stocks boost equity-based income generation potential

Volatile markets call for sources of stability; upside inflation risks call for diversified income generation potential within portfolios.

- For investors concerned about U.S. equity market performance, we suggest considering dividend stocks for new allocations. Dividend yielders combine characteristics of high quality and income generation that fit well into our broader market outlook. These companies also tend to be value companies, a diversifier for many growth-heavy U.S. portfolios.
- Dividend-paying equities reduce portfolio duration by delivering a greater share of their total return in the form of near-term cash flows rather than long-term capital appreciation. In effect,

they function like shorter-duration assets, with more of their value realized upfront. This is particularly attractive in a high-rate environment, where long-duration assets – those with cash flows further out – are more heavily discounted and thus more sensitive to rising yields.

- By tilting toward dividend payers, investors can reduce interest rate risk, improve cash flow resilience, and maintain equity exposure without taking on the full brunt of duration-driven volatility.

Where to find durable income in equities?

Large caps could outperform as U.S. economic risks rise

However, we also maintain some small cap exposure, especially where we see structural opportunity linked to artificial intelligence.

Small caps have been hit hardest by inflation and higher rates

- The equity market recovery from April 2022 has been driven by large cap tech stocks. We expect this to continue as U.S. economic activity slows and investors favor the historical resiliency of large companies.
- Large cap equities tend to hold less floating-rate debt than small caps do, which is why they have outperformed as interest rates have risen.

When should I buy small caps?

- It's primarily about the cycle: small cap outperformance typically occurs when the economy is rebounding, unemployment is falling, and corporate earnings growth is strong.
- This cycle, higher rates have weighed on small-cap performance. With persistent upward pressure on long-term Treasury yields, refinancing risks are likely to remain elevated, further constraining small-cap valuations.
- However, small caps saw a sharp rebound recently following the July inflation release last year, demonstrating the potential benefits of diversification. Though we believe the market's "soft landing" assumptions are liable to shift, the path is always bumpy, and some diversification can be valuable.

The small cap complex may offer overlooked growth opportunities

- Within the asset class, we think there are pockets of opportunity where investors can capitalize on structural themes like the building-out of artificial intelligence (AI).
- Small and medium-sized profitable growth companies, for instance, may offer exposure to [artificial intelligence](#) development at attractive valuations.

TAKEAWAY: At this phase of the cycle, where growth is moderate but likely slowing, large caps could outperform. Small caps may have brief moments in the sun, particularly when market rates move lower, but we aren't overly bullish on small caps until growth can re-accelerate. That said, we believe small caps offer overlooked growth potential, especially those companies with exposure to the artificial intelligence boom and profitable technology.

International equities: reassessing global allocations amid U.S. policy changes

Will international markets thrive or struggle if the U.S. turns inward?

U.S. markets have started 2025 lagging international peers

Equity market performance for a USD based investor

Sources: New York Life Investments Global Market Strategy, MSCI, S&P Global, Macrobond, September 2025. Each country, except for the U.S., is represented by the MSCI index covering the equity market of that country. The U.S. is represented by the S&P 500. The S&P 500 Index is an unmanaged index that is widely regarded as the standard for measuring large-cap U.S. stock market performance. It is not possible to invest in an index. Past performance is not a guarantee of future results.

Rebalancing the U.S. / non-U.S. equity allocation

- The extent of fiscal and deficit spending has been a key driver of U.S. equity returns, and the U.S. has consistently outspent its peers. If the U.S. starts to rein in spending while others ramp up, a more balanced U.S./non-U.S. allocation could make sense.
- Europe's outperformance, for instance, is notable in both local and USD terms (**chart**). Investors may be pricing in a "peace dividend" on the prospect the Russia-Ukraine war comes to an end. The reconstruction effort is also likely to generate significant economic activity.

Across cycles, international equities offer investors the opportunity to capture sector and business cycle diversification

- Sectors: The S&P 500 is overweight the technology and communications sectors. Europe and Japan have more exposure to cyclical sectors like industrials and consumer discretionary. Relative valuations, especially in Europe, remain attractive for bottom-up stock picking.
- Cycle: Because the global economic cycle is desynchronized, a diversified international exposure can help investors capture recovery cycles globally.

Portfolio strategy

- Many investors are structurally under allocated to international equities, limiting the potential of this asset class to provide sector and business cycle diversification.
- In conventional portfolio allocation, international equities make up roughly one-third of total equity exposure. So, in a standard 60/40 portfolio comprised of 60% equities and 40% bonds, international equities would constitute 20% of the portfolio.

See our [high conviction question](#) on this topic for more context.

TAKEAWAY: We believe that structural exposure to international equity can help investors to capture sector and business cycle diversification. Tactically, policy changes may necessitate rebalancing – increasing allocations to economies benefiting from government spending while reducing exposure to those facing cutbacks.

Emerging market equities have potential to outperform but still face headwinds

Some markets stand out, but the asset class may have difficulty outperforming as global growth slows.

A weaker dollar is likely to support EM central bank cutting and equity performance

Sources: New York Life Investments Global Market Strategy, S&P Global, Intercontinental Exchange (ICE), Macrobond, September 2025. The S&P 500 is an unmanaged index that is widely regarded as the standard for measuring large-cap U.S. stock market performance. Emerging Markets index is represented by the MSCI Emerging Markets Index. The MSCI Emerging Markets Index is a free-float weighted equity index that captures large and mid cap representation across Emerging Markets (EM) countries. It is not possible to invest in an index. Past performance is no guarantee of future results.

EM equity outperformance may be difficult with China weighing down the index

Sources: New York Life Investments Global Market Strategy, Bloomberg, Macrobond, September 2025. Emerging Market index is represented by the MSCI Emerging Markets Index. The MSCI Emerging Markets Index is a free-float weighted equity index that captures large and mid cap companies across EM countries. Emerging Markets ex China index is represented by the MSCI EM ex China which excludes China from the MSCI EM index. It is not possible to invest in an index. Past performance is no guarantee of future results.

- Emerging market (EM) central banks led the cycle on raising interest rates; many are now more advanced in their easing cycles. A weaker dollar reduces currency risk on USD-denominated debt (**left chart**), providing EM central banks room to cut rates and support their economies amid shocks to global trade.
- Many investors are under-allocated to EM equities, and so a shift in investor sentiment could have a significant impact on flows and therefore prices.
- China's economic performance remains a key risk for EM equity (**right chart**). Fiscal stimulus may step in to support the trade-related slowdown, but China's structural challenges remain.

TAKEAWAY: With U.S. interest rates likely peaked, EM equities may see greater interest throughout the year; nevertheless, we expect currency hedging and active management are key for success in the asset class.

6 Fixed income

Insights

- [Credit overview](#)
- [Investment grade](#)
- [High yield](#)
- [Bank loans](#)
- [Convertible bonds](#)
- [Municipal bonds](#)

Today's macro backdrop supports high conviction in credit allocation

We are sensitive to tight credit spreads, but strong total return potential and potential pressures on economic activity support fixed income allocation.

- Policy has widened the potential for yield volatility and created new fears about credit quality in an economy that is expected to slow. Our “solve” for both of these concerns is to stay short duration across credit types in the U.S.: investment grade, high yield, and municipal bonds.
- Spreads are tight, creating significant price risk for U.S. corporate credit. However, 1) corporate credit provides equity-like risk, and equities also have strong valuations. 2) The backdrop of credit quality has improved over time, and still-strong income generation potential make us confident in credit allocation. Should spreads re-widen due to continued volatility in

the Treasury curve or additional risk priced into corporate credit yields, this can increase investor value and create entry points. Even through a period of policy-induced slower growth, we are not concerned about systemic credit quality.

- If Treasury yields approach the high end of our 10Y range (4.0-5.0%), duration can be added as a tactical bet, but it is not our favorite place to take risk. We prefer to balance short duration Treasuries, convertibles, and corporate credit exposure with longer duration in securitized credit and taxable municipal bonds.

Ex-U.S. fixed income has outperformed in 2025

Returns from January 2025

When credit quality questions rise, we prefer maximizing yield per duration

Yield per duration (prior 30-day average)

Investment grade bonds have opportunity cost, but are a sheltered place to park

We expect credit quality to remain resilient; compressed spreads provide limited yield pickup, but any spread widening can create entry points.

Spreads have remained tight through the Fed's hiking cycle

Sources: New York Life Investments Global Market Strategy, NBER (National Bureau of Economic Research), Macrobond, September 2025.

Corporates' financial buffers are at a healthy level

Sources: New York Life Investments Global Market Strategy, Federal Reserve, NBER (National Bureau of Economic Research), Macrobond, September 2025.

- Credit spreads have returned to remarkably tight levels relative to history (**left chart**). Tight spreads are attributed to (1) a buildup of corporate cash, (2) strong credit quality, and (3) the concentration of investment grade and high yield issuers in consumer sectors, which have been especially strong this cycle. While we expect economic growth to slow, we don't expect spread widening to be driven by an inability of quality companies to pay their debts. Businesses are maintaining a healthy cash balance (**right chart**), which should help firms weather pressure on margins and operating environment uncertainty.
- When focusing on total return, IG credit has less income generation opportunity relative to HY credit, but still offers moderate yield pickup relative to cash on a risk-adjusted basis.

TAKEAWAY: Since the pandemic, companies have increasingly adopted a conservative approach to managing their balance sheets, effectively limiting overall debt growth. This trend has created an attractive backdrop for both investment grade and high yield corporate bonds. While we expect credit spreads to widen as the economy decelerates and rate volatility rises, strong credit quality helps us see past any temporary rate spikes, focusing on strong total return potential.

An off-cycle call: U.S. high yield remains one of our highest conviction ideas

Even amid mounting economic uncertainty and extremely compressed spreads, we maintain a positive outlook on U.S. high yield credit.

Strong interest coverage multiples suggest high yield credit could see further outperformance

High yield interest coverage: EBITDA-CapEx/Interest expense

Sources: New York Life Investments Global Market Strategy, JP Morgan. April 2025. Data as of April 2025. EBITDA: earnings before interest, taxes, depreciation, amortization; CapEx: capital expenditures.

The high yield "maturity wall" is far from an imminent threat to corporate health

Share of high yield corporate benchmark maturing each year

■ As of Aug 2023 ■ As of June 2024 ■ As of June 2025

Sources: New York Life Investments Global Market Strategy, Bloomberg Finance LP, Macrobond, September 2025. 2033+ represents maturities for 2033-2050. Benchmark: Bloomberg U.S. Corporate High Yield Total Return Index. It is not possible to invest directly in an index. Past performance is not a guarantee of future results.

- The U.S. high yield asset class has improved in quality thanks to changes in corporate financing structure since the financial crisis, and thanks to pandemic-era support programs.
- Cyclically, leverage and interest expense levels in high yield are healthy (**left chart**). We have high conviction that fundamentals remain strong, but as general macro risks rise, issuer selectivity becomes even more critical.
- Over half of major HY benchmark weight is now rated BB or higher. We see this quality at work in the maturity wall: high yield issuers in the U.S. have been incredibly successful at pushing out their obligations (**right chart**).
- In the event that spreads widen in U.S. HY, we see this as a value creation opportunity.

TAKEAWAY: High yield is not typically an asset class investors hold as economic risks rise, but we believe the higher quality high yield borrowers could provide significant value in a portfolio this year. For investors concerned about credit quality, macro volatility, or policy uncertainty, the relatively short-duration exposure of high yield credit is a compelling option.

Bank loans may be out of room to run

Bank loans are often the asset class that reveals credit quality concerns first. Our bias toward relative credit quality makes selection paramount.

We expect bank loans to struggle if bankruptcies rise

Sources: New York Life Investments Global Market Strategy, National Federation of Independent Business, U.S. Federal Courts, NBER (National Bureau of Economic Research), Macrobond, September 2025.

Are floating-rate bank loans the place to be when economic risks are rising?

- Currently, overall yields appear to compensate investors for the greater degree of credit quality risk in the asset class, which stems from smaller companies with less of a balance sheet buffer against economic pressures.
- But in line with our view that large cap equities are likely to outperform small caps, and that higher credit quality is likely to outperform, bank loans may be out of room to run. We expect a slowing economic environment to be paired with accelerating inflation, meaning that floating rate borrowers may be crunched from both sides: slowing demand paired with more-expensive-than-expected borrowing costs.

Portfolio strategy

- We believe bank loans can be an important component of diversified global bond exposure. Because of their relatively lower credit quality, security selection and credit quality analysis is paramount when operating in this asset class in an unfavorable macro environment. Within floating rate bank loans, we prefer portfolios that are overweight senior secured loans with low leverage. We are closely monitoring for signs of credit quality slippage.

TAKEAWAY: In line with our view that economic risks are rising, floating rate bank loans are one of the first asset classes where we expect to see credit quality slippage. Yields are higher than they were expected to be at this point and have compensated investors for credit quality risks, but this dynamic has lost steam. Selection is paramount.

Convertible bonds look compelling, from both issuer and investor perspectives

Convertible bonds are well positioned to hedge downside risk while offering similar upside potential in the event of a broad market rebound.

Convertibles have seen renewed issuance, corresponding with stronger performance

Sources: New York Life Investments Global Market Strategy, SIFMA (Securities Industry & Financial Markets Association), Macrobond, September 2025.

What makes convertible bonds special?

- In many ways, convertible bonds offer the best of both worlds. Like equities, convertible bonds offer unlimited upside potential from the embedded call option on the issuer's common stock. Like bonds, converts offer downside protection.
- Over a complete market cycle, convertibles generally participate in about 60-80% of equity market upside and 50% of the downside.
- Converts are naturally short-duration instruments: most convertible bonds have a duration of approximately 2-3 years, limiting their sensitivity to interest rate fluctuations.

Tactical market outlook:

- Issuance: Issuance was strong in 2024 and is picking up in 2025, suggesting lower interest rates for issuers are balancing well with investor demand for upside participation in the equity features of convertibles. The market saw \$45B of new issuance through August 2024 compared to \$33B over the same period last year. Approximately one quarter of new convertible issuance last year had an investment grade rating. Issuance is expected to increase as investment grade companies with debt maturing may be drawn to the convertible market, as they can no longer issue bonds yielding 2% to 3%.
- Valuation: The U.S. convertible market is weighted towards mid and small-cap companies which now have significantly lower valuations than large caps. While we are not overweight the SMID cap space in our equity view, we find the value proposition of converts to be focused on their blended equity/bond characteristics rather than SMID cap focus.
- For investors who believe market gains can broaden but the economy may slow, convertible bond exposure could replace small- and mid-cap exposure, offering potentially similar risk/return opportunities plus the defensive bond features.

TAKEAWAY: Convertible bonds are a well-positioned defensive asset class, offering yield and low volatility. As some corporate bond issuers are priced out of the investment grade and high yield markets, we expect to see strong issuance that is both less expensive for issuers while offering a compelling risk-return dynamic for investors.

Munis provide a diversified approach to credit and duration exposure

Strong credit fundamentals make municipal bonds an attractive credit diversifier in our view, but we are wary of flows amid macro uncertainty.

Muni's tax equivalent yields exceeds AAA corporates' at longer durations

Sources: New York Life Investments Global Market Strategy, U.S. Department of Treasury, Macrobond, September 2025. The AAA corporate yield curve is populated with USD denominated senior unsecured fixed rate bonds issued by U.S. companies with a rating of AA+, AA or AA-. The Municipal AAA yield curve is populated with high quality U.S. municipal bonds with an average rating of AAA from Moody's and S&P. The tax-equivalent yield curve assumes a 37% tax rate. Duration of fixed income securities is a measure of a security's price sensitivity to changes in interest rates, measured in years.

Tailwinds & outlook for municipal bonds

- We have a positive fundamental outlook for municipal bonds. Muni investors seem to be recognizing the benefits of locking in tax-exempt income at higher-than-expected rates. Yield curve volatility makes this decision more compelling as money market yields (cash yields) face increasing Fed policy uncertainty. Like corporate bond issuers, municipalities are also well capitalized with healthy reserve balances. This strong starting point provides a needed cushion should revenues and federal aid decline. This also implies that, due to economic uncertainty, issuance is not expected to pick up in 2025.
- The benefit of tax-exemption is amplified in the current "higher for longer" yield environment. There have been some calls for the removal of the muni tax exemption, but our teams do not find this proposal to be a credible threat.

This said, municipal bonds rely heavily on volatile retail flows.

- When yield curve volatility causes wild swings in how municipal bond funds trade relative to NAV, munis have fallen victim to their skittish investor base.
- Munis may see relative demand improve due to quality; 13 states now have higher Moody's credit ratings than the U.S. sovereign.

Munis as a critical component of our duration view

- In our view, a flat yield curve gives investors little incentive to take excessive duration risk in U.S. Treasuries; however, not all duration is created equal.
- The vast majority of issuance in the municipal curves remains upward sloping, which continues to compensate investors for longer-term risk. Tax-free municipal bonds can also balance shorter-duration allocations in the money market or high yield corporate bonds.
- We also like *taxable* municipal bonds as a duration-balancing, long-infrastructure play. Higher credit quality and diversified credit exposure provide additional benefits to this portfolio construction technique, in our view.

TAKEAWAY: Instead of adding duration in Treasuries, investors can consider interest rate risk where it pays: on the municipal bond curve. While federal policy uncertainty is likely to affect the muni environment in 2025 along with all other asset classes, we do not see this as a reason to avoid the tax benefits and/or relative quality of the asset class.

7 Alternatives

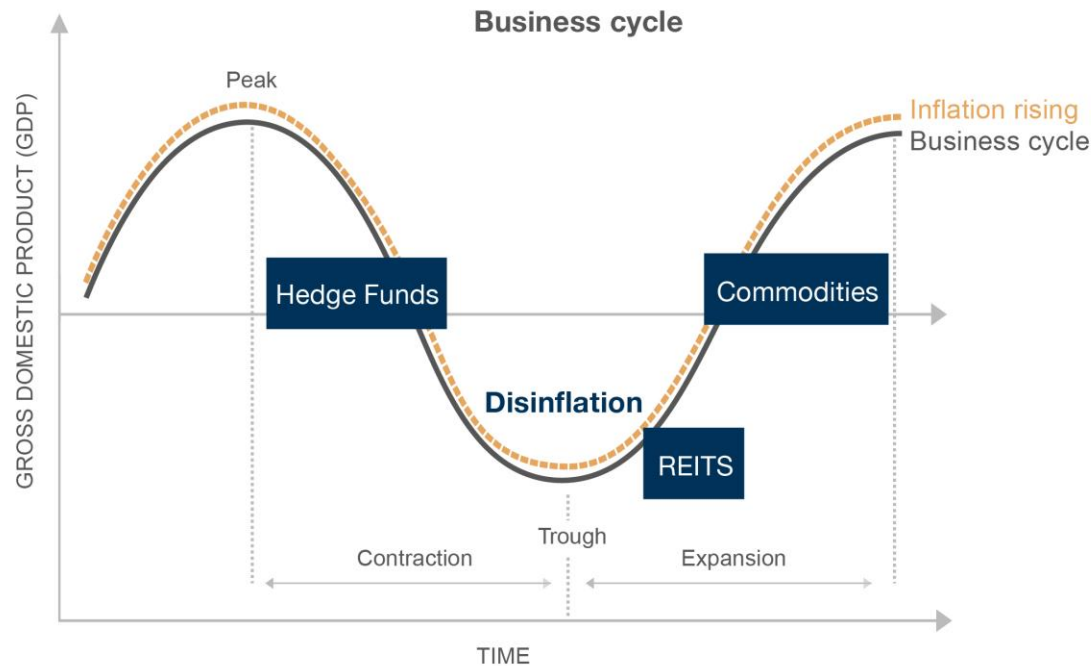

Insights

- [Alternatives through the cycle](#)
- [Infrastructure](#)
- [Commodities](#)
- [Liquid real estate](#)

Alternative investments across the business cycle

Plus: asset weighting recommendations based on quantitative portfolio risk/return analysis.

How alternative assets might perform at different stages of the economic cycle

Sources: New York Life Investments Global Market Strategy, September 2025. For illustrative purposes only

- Alternative investments offer diversification potential and are some of the least correlated public and private investment opportunities.
- Though potentially less liquid than traditional investments, performance is typically less sensitive to the movements of global markets – instead, driven by diverse sources of returns.

How much alternatives exposure do I need?

- A suitable range typically falls between 5% and 25% of a portfolio.

Commodities

- Commodities tend to benefit from sticky and rising inflation and have performed well year-to-date. The asset class exhibits very little correlation to both stocks and bonds, making it a solid diversifier and inflation hedge.
- Allocating between 1% and 7% can provide diversification and protection against inflation. Equities should be the primary source of funding this allocation.

Hedge Funds

- Not all hedge fund strategies are created equally. With equity markets rising, equity-oriented strategies like long/short and event-driven could be successful in this environment.
- A range of 1% to 12% allows for exposure to skilled fund managers and unique strategies. Typically, this allocation can be sourced from equities.

REITs

- Concern about commercial real estate has impacted investor sentiment but we think this has the potential to create investment opportunities.
- Allocating between 1% and 15% offers real estate exposure with the potential for income and capital appreciation—and can potentially be sourced primarily from equities.

TAKEAWAY: Given the risk of persistent and rising inflation, we think commodities could offer the highest risk-adjusted returns, though investors could benefit by adding exposure across alternatives.

Infrastructure is one of our highest conviction structural themes

The structural case for infrastructure is expanding just as the cyclical case (lower rates) begins to support the asset class.

AI is expected to boost data center power demand by 160% and with it, the need for more digital infrastructure

Data center power demand

■ U.S. ex-AI ■ U.S. AI ■ Rest of world ex-AI ■ Rest of world AI

Sources: New York Life Investments Global Market Strategy, IEA, Goldman Sachs Research, September 2025. TWh = terawatt hours of electricity

A secular investment case for infrastructure

- We see infrastructure as a key beneficiary of secular global investment trends. A changing economic landscape (artificial intelligence), geopolitical trends (U.S.-China competition), and a renewed focus on resource access (after the COVID-19 pandemic) has driven a surge in public and private sector investment in infrastructure. We expect this trend to persist.
- We believe that the supply chains experiencing the most change are those which may benefit the most from investment: digital transition and [artificial intelligence](#), green transition and energy independence, and supply chain re-globalization. As a result, we have particularly high conviction around global infrastructure investment with a focus on digital infrastructure (**chart**), green and brown energy, utilities, and communications.
- Infrastructure projects are increasingly funded through the sale of taxable municipal bonds.

Portfolio construction benefits in equity

- Global equity infrastructure may close a frequent investor gap in international exposure.
- The asset class offers a potential inflation hedge as cash flows are often linked to inflation, and on the cost side, inflation protection is often written into long-term contracts.

Portfolio construction benefits in fixed income

- Issuance of taxable municipal bonds increased in recent years due to the *Tax Cuts & Jobs Act* of 2017 which limited the issuance of tax-free municipal bonds. The *One Big Beautiful Bill Act* preserves the tax-exempt status of munis.
- Investors may be less familiar with taxable municipal bonds, especially outside the U.S. where municipal bonds are less frequently used. We believe this asset class may provide additional means of generating yield, with the benefit of higher quality and diversified credit exposure.
- We also like taxable municipal bonds as a duration-balancing, long-infrastructure play.

TAKEAWAY: The global economy is shifting, and we believe that infrastructure provides a durable opportunity to capture that change. We perceive infrastructure as a structural allocation in both equity in fixed income, allowing investors access to these trends as well as important portfolio construction benefits. Importantly, an interest rate cutting cycle has historically supported sectors such as utilities and energy that tend to make up important portions of the infrastructure asset class, adding cyclical firepower to an already strong structural case in our view.

Higher inflation points to a medium-term allocation to commodities

Rising demand for resources amid restructuring supply chains provides a compelling investment backdrop for commodities.

Commodities play a more important role in portfolio allocation when inflation is high

Stock-bond correlation works better when inflation is closer to target

Sources: New York Life Investments Global Market Strategy, U.S. Bureau of Labor Statistics (BLS), S&P Global, U.S. Department of Treasury, Macrobond, September 2025. Stocks are represented by the S&P 500. Bonds are represented by the monthly return on a U.S. 10-year government bond. Core inflation is represented by the Core CPI index. Core CPI is represented by the core Consumer Price Index. CPI is a measure of the average change over time in the prices paid for a market basket of consumer goods and services. Core CPI excludes volatile food and energy prices. The S&P 500 Index is an unmanaged index that is widely regarded as the standard for measuring large-cap U.S. stock market performance. It is not possible to invest in an index. Past performance is not a guarantee of future results.

Active management is key when choosing a commodity allocation

■ 12-month return ■ 3-month return

Sources: New York Life Investments Global Market Strategy, S&P Global, Macrobond, September 2025.

- When inflation is high, stock-bond correlation tends to be higher. Investor portfolios may therefore be less diversified than finance theory would suggest (**left chart**).
- Since the cause of that potentially lower diversification is high inflation, investors could consider increasing their allocation to commodities which may help to manage both risks.
- Not all commodities trade equally (**right chart**); active management can help investors identify commodities with positive momentum (positive 3-month and 12-month returns) and avoid those with negative momentum (negative 3-month and 12-month returns).

TAKEAWAY: We think investors should consider adding commodities exposure as a hedge against persistent inflation and in response to global dynamics such as escalating trade tensions and the push for critical resource access.

Structural opportunities are opening in liquid real estate

Concern about pockets of commercial real estate, such as office, has impacted investor sentiment, creating potential opportunities.

Debt markets don't appear overly concerned over commercial real estate stress

Real estate equities have the lowest correlation with a change in rates - the asset class should outperform as rates come down

6-month correlation of 1-month changes

- U.S. commercial real estate (CRE) experienced a one-two punch in the past several years. First came the pandemic, which pushed many white-collar jobs to work at home for a time, a trend that has been sticky in the U.S. Then came the interest rate hiking cycle of 2022–2023.
- As the economy slowed, questions were raised about whether write-downs in CRE valuations could prompt a new wave of banking losses, given the outsized exposure of small and mid-cap (SMID) banks to CRE loans.
- A majority of investors, bankers, and regulators are highly focused on CRE risks. That could imply any issue bubbling up would be quickly addressed as it was in April of 2023 and may be why bank bonds are outperforming the broader market (**left chart**).
- Despite a general downturn in the asset class, liquid real estate stood out as the top performer when yields declined at the end of 2023. Notably, the sector has one of the lowest correlations with changes in yields. We expect further cuts from the Fed could benefit the asset class (**right chart**).

TAKEAWAY: Liquid real estate could present opportunities for savvy investors. Lately, REITs haven't kept pace with the broader market, partly due to concerns about their exposure to office spaces and other less desirable assets. Yet, it's important to recognize the breadth of the REITs sector and the crucial role of active management. Wise portfolio managers have been focusing on the growing industrial and technological segments within the REITs market. We think it is worth noting liquid real estate stand out as the top performer when yields decline.

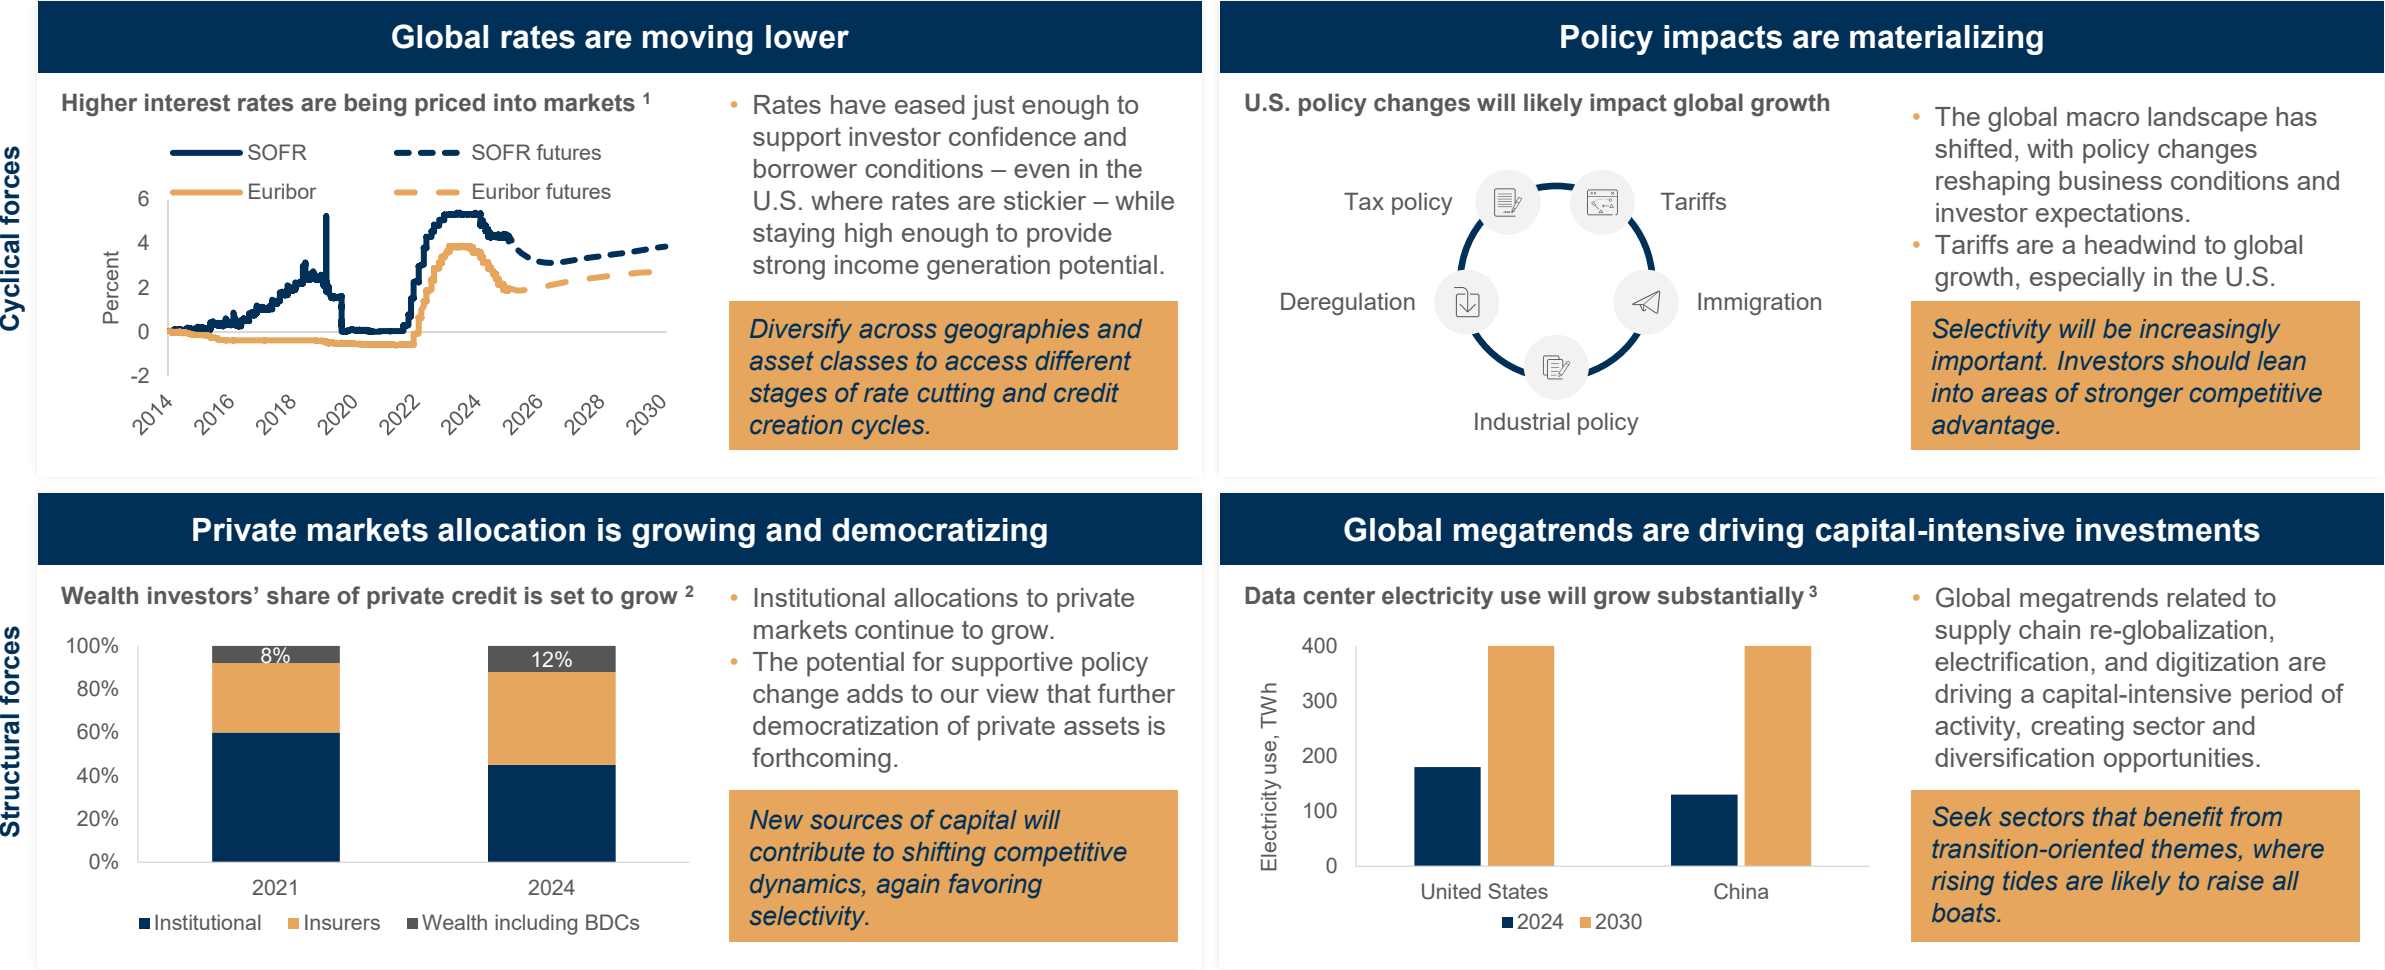

8 Private markets

Insights

- [Allocation to private markets is growing and democratizing](#)
- [Key takeaways per asset class](#)
- [A global case for the lower middle market \(LMM\)](#)

Macroeconomic forces impacting private markets

Lower rates and structural shifts are driving a recalibration in private markets, even amid policy uncertainty.

Sources: Opinions of New York Life Investments, August 2025. 1. Federal Reserve, European Central Bank (ECB), Bloomberg, Macrobond, August 2025. The Secured Overnight Financing Rate (SOFR) is a broad measure of the cost of borrowing cash overnight collateralized by Treasury securities. The Euro Interbank Offered Rate (Euribor) is a daily reference rate, published by the European Money Markets Institute, based on the averaged interest rates at which Eurozone banks borrow unsecured funds from counterparties in the euro wholesale money market.. 2. Sources provided below on later slides. 3. International Energy Agency, CBRE Investment Management, China's State Council, S&P Global, U.S. Energy Information Administration, August 2025, with data available through May 2025. TWh = terawatt hours of electricity.

Investor allocation to private markets continues to increase...

In the past, lower-for-longer interest rates drove investor attention to private markets. Now, even amid higher rates, allocation has grown.

- After the global financial crisis, lower rates forced institutional investors to seek yield and higher returns from private markets. In the current environment, interest rates are higher, but allocations continue to grow. Data on investor allocations suggests that investors have more appreciation of the diversifying benefits of private markets.
- New investment products and technologies are opening private markets capabilities to a broader range of investors. Wealth investors have emerged as one of the fastest growing segments in private markets investing, fueled by evergreen fund structures and technological advancements that have streamlined the purchasing of private assets. The potential for supportive U.S. policy change, such as the examination of private assets for retirement portfolios, adds to our view that further democratization of private assets is forthcoming.

Institutional investors have steadily increased their allocations to private markets

Institutional investor asset allocations, 2014 - 2024

Sources: McKinsey, CEM Benchmarking, 2024. Data for 2024 is not available.

Wealth investors' share of private credit has and is expected to increase

Estimated AUM in credit for the largest seven private markets firms by client segment

Sources: Oliver Wyman estimates based on company disclosures, filings, and earnings calls. August 2025 with data available through July 31, 2025. Client segments as defined by each individual firm. Note that there may be some differences in perimeter definitions across firms, although efforts have been made to normalize wherever possible when information is available; Wealth including BDCs is based on company disclosures on AUM from wealth/retail channels wherever possible, however where estimates were made using BDC reporting, some institutional capital may be included. Efforts have been made to exclude institutional capital from BDC figures where possible; institutional includes AUM from all other sources. Business development companies (BDCs) are U.S.-regulated investment vehicles that provide debt or equity financing to small and mid-sized private companies, often in the lower middle market.

... desire for access is driving democratization of private markets, too

Public equity market concentration and the proliferation of private markets knowledge creates interest among more qualified investor types.

- Product innovation in the private markets space has created opportunities for qualified investors to fundraise among a larger set of investors, including high-net-worth investors. Interest in private markets strategies among these investors has grown in part due to its historically higher return and low volatility profile (though infrequent mark-to-market policies contribute to this expectation).
- However, several trends in public markets have also contributed to this dynamic. In equity, for example, fewer and fewer companies are listed for public shareholding (**left chart**). In recent years, as large-cap technology stocks have outperformed the index, equity market concentration – both geographically (**middle chart**) and strategically (**right chart**) – has increased. These dynamics give investors the perception that the public markets do not provide as diverse an opportunity as they used to, nor do they provide efficient access to the “main street” or early-stage opportunities.
- As a result, we have seen an increase in qualified investor curiosity about and allocation to the private markets as an opportunity to diversify their equity holdings. This includes access to the “main street” opportunities for value creation that the middle market and lower middle market provide.

Company ownership has moved steadily from public to private markets

Our key takeaways per private markets asset class

Private and illiquid strategies may not suit all qualified investors; those with access can consider these high conviction themes.

Private equity	Private credit	Real estate	Real assets
<ul style="list-style-type: none"> • 2025 has yet to deliver the rebound in deal activity and fundraising that many investors anticipated. While exit volumes have shown modest improvement, managers remain reluctant to sell below target valuations – stalling the private equity flywheel of exits, distributions, and reinvestments. • As deal flow expands, activity is likely to move down the quality spectrum, putting pressure on overall valuations. • Even in a slower environment, private equity remains a vital component of a multi-asset portfolio – offering the potential for outsized returns, meaningful diversification, and growing liquidity access. • Importantly, today's macro uncertainty has tipped the balance of power in favor of limited partners, creating more favorable terms and broader opportunities for liquidity generation. 	<ul style="list-style-type: none"> • Despite economic uncertainty, private credit growth continues, and risk-return dynamics remain positive for the asset class. • Selectivity is essential as sticky U.S. rates and slower growth pressure lower-quality borrowers. • In Europe, structural tailwinds and bank pullback support opportunity, but increased competition requires a focus on smaller, sponsor-less deals. • Resilience is strongest in the middle and lower middle market, where credit quality remains high, competition is lower, and relative value is compelling in our view. • The appeal of private credit remains underpinned by defensive structures and long-term relationships, offering portfolio stability and stronger recovery characteristics in the event of economic deterioration. 	<ul style="list-style-type: none"> • Differences in market interest rates, and policy changes in the U.S., are contributing to a divergence between U.S. and European real estate markets. • In Europe, the rate-cutting cycle has allowed long-term yields to fall, reducing pressure on valuations and allowing price discovery. The recovery cycle is well underway. • In the U.S., investors are still adjusting to higher-for-longer rates; but in many sectors, valuations have likely already bottomed. • Demographic shifts and internal migration are reshaping local supply and demand dynamics, both within and across regions. • Foundational structural trends, such as re-globalization, digitization, and the continued rise of e-commerce, are also driving capital formation. 	<ul style="list-style-type: none"> • Recent geopolitical developments have strengthened our conviction that global transitions – digitization, electrification, and supply chain re-globalization – will drive increased demand for real assets. • This demand may emerge through two channels. First, there is a physical need for commodities and materials to build the infrastructure supporting these megatrends. Second, the capital-intensive nature of this shift may lead to higher inflation and interest rate volatility – environments in which real assets have historically outperformed. • Despite higher valuations in the foundational layer of megatrends like AI, valuations for the inputs to these investment processes have not seen as much uplift. We believe that attractively priced assets with cash-flow-generating properties may provide return generation and diversification potential.
<p>Investor approach: Private equity still provides outsized return and diversification potential in our view – stay invested. We favor the middle and lower middle market for its strong returns and tendency to outperform amid risk.</p>	<p>Investor approach: Focus on resilient segments like middle market direct lending, with disciplined manager selection and attention to competitive dynamics across regions.</p>	<p>Investor approach: Leverage country and regional differences to capture cyclical opportunity. Focus on sectors with durable demand growth, such as those driven by foundational changes in demographics and global megatrends.</p>	<p>Investor approach: Opportunities related to global transitions (digitization, electrification, supply chain re-globalization) have become clear. Diversify a private portfolio by considering the natural resources inputs to that process.</p>

Opinions of New York Life Investments, 2025.

We believe the lower middle market presents a global private opportunity

Qualified investors may benefit from focusing on less efficient parts of the market; the lower middle market is one such opportunity in our view.

- Private markets have reached a considerable \$14.5 trillion in size across asset classes. Still, they remain a small portion – just 4% – of the total investable market. At the same time, company financing trends have shifted. The number of listed companies has fallen from 7000 to 4000 since 2000, and equity market capitalization has become increasingly focused in the United States.
- In response, more types of qualified investors are shifting their focus to private markets, seeking return potential and diversification. We believe qualified investors should focus on areas of the market that are less efficient, or where return characteristics cannot be as easily achieved in public markets. We see the lower middle market (LMM) of private equity and private credit to be one such opportunity – and one that is particularly attractive at the capital markets turning point investors may be facing today.

Our case for the lower middle market

What is the lower middle market (LMM)?

- The lower middle market is typically defined as companies with less than \$250 million in enterprise value, or private equity funds with less than \$1 billion in assets under management. The middle market is typically larger, with up to \$500 million in enterprise value. Large companies are typically those with \$1 billion or more in enterprise value.
- The number of companies in this segment is much larger than it is for large companies, providing a deeper pool of acquisition opportunities.
- Companies tend to be family or founder owned, so investment is typically the first institutional capital applied to the company's business.
- Qualified investors can focus more holistically on value creation through business building, rather than focusing on financial engineering as is typical in larger parts of the market.

Benefit	Description
Competitive resiliency	<ul style="list-style-type: none"> • The lower middle market offers an attractive supply-demand imbalance, with a large number of potential target companies and lower fundraising volume. • Historically, the supply-demand imbalance for companies / assets has resulted in attractive entry valuations, with smaller companies trading at a discount to larger companies. • Deep pools of capital available to potential acquirers, such as corporate strategic acquirers and large/mega private equity funds, can result in consistent exit opportunities. • The cyclical nature and variability of bank loan volume create the need for private financing in credit markets.
Economic resiliency	<ul style="list-style-type: none"> • Lower middle market funds have historically outperformed larger segments over the long term, including in high interest rate and high inflation environments. • Contrary to common belief, company size explains only 6% of default frequency, whereas higher leverage, which is a key characteristic of larger funds, is the largest factor explaining expected default frequency.
Portfolio resiliency	<ul style="list-style-type: none"> • Lower middle market, middle market, and large & mega funds can offer diversification benefits and complementary exposure when paired together.

Important disclosures

The commodities industry can be significantly affected by commodity prices, world events, import controls, worldwide competition, government regulations, and economic conditions. The precious metals market can be significantly affected by international monetary and political developments such as currency devaluations or revaluations, central bank movements, economic and social conditions within a country, trade imbalances, or trade or currency restrictions between countries. Fluctuations in the price of precious metals often dramatically affect the profitability of companies in the precious metals sector. The precious metals market is extremely volatile, and investing directly in physical precious metals may not be appropriate for most investors.

Prospective investors should be aware that investments in private funds or alternative investment strategies are suitable only qualified investors who do not require liquidity and who can bear the economic risk, including the potential for a complete loss, of their investment. A Qualified Investor, also known as an accredited investor, is an individual or entity that is legally permitted to invest in hedge funds, venture capital funds, private equity offerings, and other private placements. This qualification is typically based on the investor's income and net worth.

All investments are subject to market risk, including possible loss of principal. Diversification cannot assure a profit or protect against loss in a declining market. Active management typically involves higher fees than passive management.
